## Patients suffering multiple allergies and unable to work

**Female patient: "I never would have thought life could be so good."**

At the start of March last year a 36-year-old female patient came to my practice after hearing a presentation on bioresonance therapy that I had given in the local adult education centre. She was suffering from multiple allergies and was taking high doses of antihistamines. Unfortunately these were no longer having any effect. She suffered from itchy, swollen eyes, hayfever with fits of sneezing and even asthma attacks. After eating apples and nuts she could not get her breath and she developed a skin rash if she ate carrots. She had attended an outpatients clinic, but this didn't help.

Her hayfever and asthma symptoms started when early flowering plants came into bloom and lasted for the whole summer. As soon as the pollen disappeared, she always caught a cold as her immune system was so weak. She has since become unable to work. Although she had to pay for her own bioresonance therapy, she resolved to undergo this treatment because she could see no other alternative.

Testing with Bicom revealed pollen allergies to all early flowering plants, various trees and grasses. She was also allergic to moulds and cross-allergies to nuts and apples. There was an underlying mercury stress, a pronounced Candida mycosis and a cow's milk allergy present. The Candida stress was treated with a change of diet and Nystatin. The priority was allergy-relieving therapy with the Bicom for the acute pollen stress as well as treatment for the mould allergy. The milk allergy was then systematically treated with the corresponding allergy programs in combination with a metabolic program, as well as apple, nut and carrot intolerance. This was followed by mercury elimination, supported again with the program for increasing powers of resistance.

The patient was treated by me for a period of four months. At the end of June the treatment was complete. The patient was free of symptoms, felt well, could work again, eat anything she liked and no longer needed medication. The success of the treatment convinced her about bioresonance therapy and she is very grateful that this type of therapy was available to help her. She confirmed: "I never would have thought life could be so good."

E. Aenderl,  
Naturopath, Happurg

# Hayfever

## Female patient: my first allergy-free summer

In 1996 I suffered from hayfever for the first time. My eyes were very itchy, watered and were almost swollen shut. My nose kept running or was blocked and I suffered shortness of breath. I had patches of psoriasis on my face and my whole body itched. I also had a cat hair allergy.

I made appointments with a dermatologist and allergologists. I was prescribed a cortisone ointment for my eyes and cortisone spray for my bronchial tubes. The swelling around my eyes eased slightly when I used the cortisone, but they continued to be red and still itched. My nose ran less, but still ran. The cortisone spray provided some relief to my bronchial tubes, but I felt nauseous for around an hour after I used it.

Since I found this treatment to be unsatisfactory, I went to a naturopath, where I received calcium therapy using my own blood. I'm afraid of needles and I found it very stressful when they took blood from me, because I have poor veins. My symptoms improved, but without any drastic success. I also received other naturopathic treatments, including acupuncture, neural therapy and foot reflex zone massage. That also brought little relief. My allergy symptoms lasted from March to October every year and so for me the best time of year was always a period of discomfort.

In early 2001 a friend who used to suffer from allergies told me that a therapist had really helped her with bioresonance therapy. I got the address and telephone number from her and phoned straight away to make an appointment. Unfortunately there was a waiting list at the practice and the next free appointment was in another two months, as word of its success had got around and the practice was attended by patients from all over Germany. Luckily my allergies hadn't started up yet.

I first went for bioresonance therapy in mid-March. A biophysical test procedure revealed that I had an allergy to birch, lilac, grasses, nuts, various metals, wheat and cat hair. What I found incredible was that they were able to find out more than the dermatologist had been able to with the prick test.

The allergies were treated with the Bicom device. At the end of April the pollen allergy treatment was complete and I was free of symptoms. I could scarcely believe it! Next to the practice was a huge meadow. Once I received my final pollen treatment, I left the practice, ran to the meadow and stooped down so that I my face was close to the grass, taking in deep breaths

right across the meadow. And I didn't have any allergic reaction! This was simply phenomenal. I was so happy and enjoyed my first allergy-free summer since 1996.

I then had my remaining stresses treated. Overall I attended eleven bioresonance sessions.

I was also finally able to fulfil a lifelong wish once the treatment was complete: a dog of my own. Because I could now take it for walks all year round without any problems.

Patient Nicole Iconomou  
Spring 2004

## Patient report:

# “I no longer have an allergic reaction to cats”

Son Marius with kitten Lucy

When we went on holiday last summer to a farm in the Czech Republic my children discovered a tiny, half-starved kitten in a stable. It had obviously been neglected by its mother. It was in a pitiful state. We fed it up until it was better again and by the end of the holiday we had grown so attached to it, particularly my elder son Marius, that we decided to take it home. Smilla, as we named the kitten, grew into a fine cat and became a much-loved member of the family.

We were all delighted when she had three enchanting kittens in August. The whole family lay on the floor in order to share in her joy of motherhood at close hand. We were all agreed that we wanted to keep one of them – little Lucy.

Soon afterwards we took our main holiday to Italy for two weeks, without the cats of course.

Imagine my shock when I subsequently discovered that it wasn't just the kittens that had developed so splendidly in our absence - I had unfortunately also developed an allergy to their long hair.

I couldn't stop sneezing and my eyes itched dreadfully. Not only was this extremely unpleasant but also posed a serious risk to my work as a professional speaker in the area of media production, as I obviously can't speak into a microphone with damaged vocal cords. Something had to be done straightaway.

My first port of call was our homeopath, who despite prescribing me medication (Tuberculinum Bovinum LM 18) was also clear that I had to get rid of the kittens: "Remember, this is for the good of your health."

I wasn't happy with this solution at all, particularly as my children were dumbstruck when they learnt that they would have to part with little Lucy. There was strong opposition to this and it was clear that we needed to find another solution.

The next call I made was to a bioresonance therapist, who provided me with some comfort. At the first treatment session I had to bring saliva and hair from all the cats with me, because she needed the information from these substances for the bioresonance therapy.

My oldest son, who was most adamant that we didn't give away the cats, was quick to help me in preparing for the appointment. He carefully dabbed with cotton wool buds in the tiny mouths of the cats in order to collect saliva and snipped small tufts of hair from the cats' fur with nail scissors. Everything was then carefully packed together for me to take to the Bicom treatment. It seemed a bit odd what the therapist was doing, but the treatment itself was very relaxing and didn't involve any jabs or such like.

After the first session I came home, put my nose into the mop of fur and – nothing happened! I didn't get a tickly nose and my eyes didn't start to itch. It was simply amazing! Needless to say that to the great joy of my children I had the all-clear and our kitten Lucy could stay with us.

I went to two post-treatment sessions and I no longer have an allergic reaction to cats. Our children are very happy about it. I am delighted with the bioresonance therapy and have recommended it to friends! It's just a shame there aren't more doctors around offering this form of therapy.

Ruth Stefani

## **A good feeling, being able to help patients**

### **Fireman rescued from severe asthma**

Bioresonance has been extraordinarily successful in the treatment of asthma too. Adults and children who have suffered from asthma for years are well again thanks to Bicom therapy.

And this was also the case for a 48-year-old fireman who had suffered from asthma for a number of years. The illness had started back in childhood with hayfever and shortness of breath, which gradually developed into acute asthma.

He had exhausted all that conventional medicine had to offer. The patient had been to specialist after specialist over the years. As well as a GP he had consulted a lung specialist, cardiologists and allergologists.

A prick test carried out by an allergologist revealed allergens such as house dust mites, moulds, animal epithelia etc. This was systematically treated with Aeromax inhalation treatments as well as cortisone tablets and sprays. But none of this brought lasting improvement and merely suppressed the symptoms.

He was no longer able to cope with his gruelling 24-hour shifts as a fireman. And he was suffering from frequent bouts of shortness of breath. In September 1996 he had a life-threatening asthma attack and had to undergo emergency treatment.

In March 1997 he came to my practice. After a detailed discussion about his medical history I carried out a kinesiology test using the Bicom device. The test confirmed a house dust mite allergy - the same result confirmed by the allergologist. However, other allergens tested positive too.

Seven Bicom treatments were undertaken at weekly intervals, which focused mainly on treating the house dust allergy.

In addition I applied Bicom programs to stabilise the intestinal flora, build up the immune system and eliminate toxins. All these programs are pre-installed in the Bicom device and can be retrieved for testing and therapy.

There was an almost 90% improvement after the first seven treatments.

He no longer needed his cortisone spray. From July a further four treatments were administered at monthly intervals. In October 1997 he came for his final asthma treatment. He was doing extremely well. That was almost eight years ago and he hasn't had any asthma symptoms since.

When he came to my practice about a different ailment a while ago he explained enthusiastically that he had built a wooden house. All the dust and dirt created while he was building hadn't harmed him or his lungs at all. Even stress and strains at work – he is still exposed to high levels of stress – no longer bother him.

He is just one of hundreds of patients who I have successfully treated with the Bicom. It's a good feeling, being able to help patients in this way.

Fr. Prigge-Jugsch  
Naturopath

## **A mother reports:**

### **Help with asthma**

The Management team at Regumed received the following letter from the mother of a child suffering from asthma.

Dear Frau Brügemann, Herr Brügemann, my name is Nancy Langhein-Mayr and my daughter was treated using the Bicom device and it has brought about unimaginable improvements. I am absolutely fascinated about this method and the device.

My 5-year-old daughter loves animals more than anything. Because of severe allergies to dog and horse hair, house dust and other materials Sandy suffered from a full range of symptoms, such as reddened eyes, colds and even asthma attacks.

And of course it's doubly hard for children to have to keep away from animals. The symptoms became worse and worse and Sandy was taken to a children's hospital suffering from severe asthma. The results were a real shock to me. Our daughter had to inhale cortisone for 3 – 4 months. There were no long-term improvements – there seemed to be no chance of curing it and she needed to inhale the cortisone every time she came into contact with an animal.

While we were searching for a suitable treatment she was treated by a therapist with bioresonance, although using a different device, and this did not bring about any improvement.

We then switched to a doctor who had a Bicom device and after a short time almost all of her allergies had totally disappeared. After 11 sessions my daughter Sandy is doing so well that I'm convinced that she will soon be completely cured.

Sandy can now look after my mother-in-law's dog and play with him. Last week she even went riding! She hasn't had any kind of allergic reactions. I'm just so happy with the improvement.

In my opinion any doctor who really wants to help his patients almost has an obligation to buy a device. And I think that it is cost-effective too, because individual treatments do not take long and the device can be used for multiple patients.

Sandy

I am so impressed and wish with all my heart that many more patients can be helped in the same way. I think that this method should become more widespread and that more doctors should use a device like this. I am even considering whether to quit my current job in order to help this method generate the success it deserves. Thank you once again and please let me know if I can help in any way to raise awareness of this therapy.

Yours, Nancy Langhein-Mayr  
Winter 2003

## Small child with asthma

# Hannes is able to breathe deeply and freely again

When little Hannes was seven months old he developed spastic bronchitis and was increasingly prone to asthma attacks. At this time he also suffered from a chronic blocked nose and occasionally itching eczema on his hand.

He received conventional medical treatment and each day had to inhale a solution containing DNCG. This didn't bring any lasting improvement, however.

At the age of four Hannes came to our practice with his mother. Kinesiological testing revealed allergy to cows' milk, white flour, house dust and severe infestation with mould.

The cow's milk allergy was treated first of all with the Bicom device. Two Bicom treatments were necessary. The wheat allergy was then treated.

In addition, the Bicom programs "toxin elimination" and "stimulating metabolism" were used. A perceptible improvement was seen after just three therapy sessions. Hannes was able to breathe deeply and freely once more and the eczema on his hand had disappeared. He no longer needed to inhale solutions every day. Four Bicom treatments were carried out at weekly intervals, during which we treated the house dust allergy and mould stress.

A total of seven therapy sessions were needed over the course of two months. Today Hannes is completely free of symptoms - six years on.

Dr. Jürgen Hennecke, Aachen  
Summer 2005

## Help with extensively treated cases?

### For more than 10 years extreme allergic reactions with severe shortness of breath

In order to find out whether bioresonance really works, when I initially began working with the Bicom I mainly treated patients who were really unwell. At the back of my mind I thought that the device would need to be really good to help with these extreme cases.

The results were clear to see: I was able to help several chronically ill patients, who I had previously treated with various conventional methods.

Bioresonance is a new and flourishing branch in my small practice. In the two and a half years that I have been using the Bicom device I have treated around 400 patients. To begin with I talked to the patients in detail about this therapy method, something which I found very important as a starting point. This was the only means of finding out how high the success rate was. And in our practice this lies between 80 and 90%.

There are days when I carry out considerably more work with bioresonance than my conventional panel practice. For health reasons I halved my practice time six years ago. Without bioresonance my practice probably would not have survived. Word of mouth now means that patients ask after this treatment without prompting.

I would like to report on one particular case. This patient (nursery teacher, 39 years old) had been suffering for some time from extreme allergic reactions with severe shortness of breath. These restrictions in her living environment, the way she lived her life and also the impact on her working day were very difficult for her to cope with.

In Spring and Summer she hung damp cloths on the windows in her flat in order to keep out some of the pollen. She had been taking medication such as Livocab, Peritol and other antihistamines for a number of years in the hope of getting her ever-increasing symptoms under control.

For more than 10 years she came to me for treatment, but I had not been able to really help her. When I got the Bicom device I advised her to try bioresonance therapy.

She agreed and when she was tested it turned out that she was allergic to several substances. The main allergens detected were birch, cats and sheep's wool.

I treated her ten times at weekly intervals; after this time she was completely free of symptoms.

Recently she came to my practice for another reason and was happy to report that she no longer had any allergic reactions. Her last treatment was some two years ago. She is of course delighted about this and patients regularly come to me on her recommendation.

If I could give my colleagues any tips, I would say that I think it's very important to test for yourself whether a treatment method works or not. Because this is the only way of being certain and forming an opinion. I haven't regretted my decision to use bioresonance. On the contrary, I am only too happy to recommend it.

Rainhart Neumann,  
General practitioner

# Permanent cold and watering eyes for months with occasional shortness of breath

## ENT specialist: Bicom bioresonance method – a good way to offset lower revenues as a result of the health reform

For more than three years I have been working in my ENT practice with the bioresonance method. Despite initial misgivings about whether this therapy really pays for itself, the successes I have had using this type of therapy every day are proof that I made the right decision.

As an ENT specialist I have a number of allergy patients. The Bicom bioresonance method offers an excellent opportunity to really help patients suffering from allergies.

This was the case for a young man who had been suffering for months with a permanent cold, watering eyes and the impulse to sneeze. Sometimes he also suffered from severe shortness of breath, sometimes even asthma attacks.

Since antihistamines only brought short-term relief, his then ENT specialist advised him to have an operation on his septum and nasal conchae. He was told that otherwise these tiresome symptoms would probably not disappear.

Reluctant to undergo surgery, he switched doctors and came to our practice. A test using the Bicom device revealed an allergy to house dust mites. This allergy was not identified previously using conventional allergy tests. The allergy was treated using the corresponding Bicom programs. After three sessions the patient was able to breathe deeply and freely again, the itching and watering eyes had disappeared and he was no longer experiencing asthma attacks.

Given the impact of the health reform the Bicom is a good way of making up for lower revenues. ENT, eye and skin specialists are all negatively impacted by the health reform. The most important thing for me is to really be able to help my patients. But I am also happy that I can offset falling revenues by using the bioresonance method. And so I can say that this type of therapy is not only therapeutic, but also makes good financial sense.

Dr. med. Heinz  
from Halle

Editor's note:

The following study proves that the success experienced by Dr. Heinz is not an isolated case. This study was carried out by Dr. Huang S. et al. It is a prospective, randomised, controlled parallel group study (level of evidence 1– 2)\*.

Efficacy was assessed using a 3-point scale: very effective, effective and ineffective. The success rate is shown in the following diagrams.

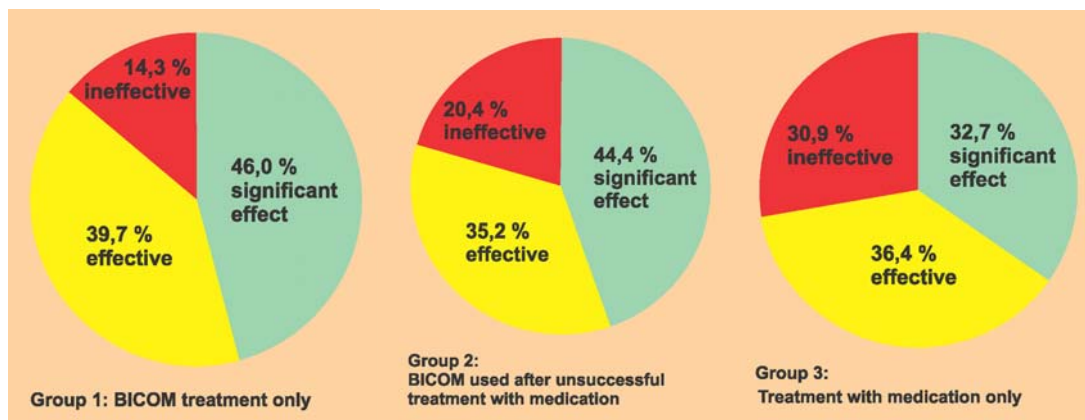

172 patients with allergy-related colds and allergic bronchial asthma were included in this study.

The patients were distributed into 3 groups.

**Group 1:** BICOM treatment for children with first-time diagnosis

**Group 2:** BICOM treatment for children who were previously unsuccessfully treated with medication

**Group 3:** Control group, children with first-time diagnosis, treatment with medication

\* The studies carried out are taken from the volume "Are there evidence-based studies on the effectiveness of bioresonance therapy?", published by the International Medical Working Group on Bicom Resonance Therapy (IMA BRT). Dr. Volker Rahlfs, C. Stat. (RRS), Head of the Institut für Datenanalyse und Versuchsplanung (Data Analysis & Study Planning) founded in 1966, was commissioned to carry out an assessment on the present studies relating to the Bicom bioresonance method. Classification of the levels of evidence according to the American Heart Association (AHA), modified according to W.F. Dick: Evidence based emergency medicine.

## **40-year-old woman suffered for 25 years from a runny nose and watering eyes**

### **Doctor's assistant: I could fill an entire book with allergy therapy success stories**

We have been using Bicom bioresonance in our practice for six years. I am a doctor's assistant and after I completed the necessary training at Regumed my boss delegated Bicom therapy to me. It has been running very smoothly and every day we achieve great therapy results. This is especially the case for the area of allergy therapy, which has a particular relevance in our practice.

Every year we experience an influx of new patients during the pollen season, who have come to our practice on someone's recommendation. News of success stories quickly spreads.

One example is the case of a 40-year-old women, who had been suffering for 25 years from a runny nose and watering eyes. This wasn't just seasonal – it lasted all year round. Dermatologists, allergologists and even her GP had not really been able to help her over the years and only wrote new prescriptions to suppress the symptoms. None of them were able to pinpoint the underlying cause of her symptoms.

It was recommended that she come to our practice. Her face was completely swollen and she complained of headaches. The pollen from summer flowers was having a negative impact on her general state of health and irritating the connective tissue membrane in her eyes and nasal mucous membrane. This also affected her mood.

First of all I carried out an acute allergy treatment with the Bicom device, after which she felt a bit better. After this she had a further ten treatments at weekly intervals. I also used allergy programs stored in the Bicom device.

In addition I carried out an intestinal clean-up as well as an amalgam elimination with the bioresonance method. Since I have been working with the Bicom method I have discovered that in many allergy patients an amalgam stress is also present.

Some time ago this patient called by again to thank us. She now feels like a new person and has become much more active again!

Ms Spichtinger  
Doctor's Assistant  
Helmut Eder practice

# Chronic nasal mucous membrane inflammation

## After six years, nose finally free from inflammation

Over a period of six long years one 47-year-old patient could barely breathe through her nose. Her nasal mucous membranes were severely swollen. She could only really breathe through her mouth.

Her nose had to be continually punctured and the entrances to her paranasal sinuses unblocked. The ENT specialists could not do any more. In her state of distress the patient underwent this unpleasant procedure time and time again. But this never had any lasting effect.

When she eventually turned up at my practice, she said she was prepared to be treated with bioresonance therapy straightaway. She didn't mind what this involved – she just wanted something to help her. And it certainly did.

I treated her with the corresponding therapy programs stored in the Bicom device. It worked wonders!

During therapy her nose opened up and the patient was able to breathe freely again! She couldn't believe it: "This is amazing – how have you done it?"

The treatment didn't just have an impact at the point of treatment. It was also part of a self-healing process. At night at home the patient used to feel like small bubbles were popping in her nose. Now the whole horrific experience was behind her.

After just one treatment Ms O. has been able to breathe deeply and freely for four years.

Erika Mund  
Bicom therapist

## Considerable health problems since the age of 2: sensitivity to chemicals

### **The parents' view on the Bicom method: we didn't know that the medicine was so far advanced!**

Our son had been experiencing considerable problems since the age of two: headaches, high temperature, earache, conjunctivitis, muscle and joint pain, hyperactivity and so on. Conventional medical treatment merely consisted of prescribing antibiotics and stays in hospital. Later it turned out that he had a sensitivity to chemicals caused by materials and furniture containing formaldehyde. Following advice from an environmental specialist in Traunstein we managed to get the disease largely under control by making numerous costly modifications to the house. But if our son was with friends or elsewhere and came into contact with the materials he had an intolerance to, his symptoms reappeared and he wasn't well at all.

Through a friend of ours we learned about bioresonance therapy and were given the address of a therapist by Regumed. Because of the bad experiences we had suffered over the years I was very sceptical to begin with. I doubted whether there was really any point in going.

But since our son's health was so unsatisfactory we visited the naturopath in May 2003 for the first time. After a comprehensive medical history was taken we got to know more about the Bicom device as an excellent diagnostic and therapeutic device. We weren't aware that this medicine was so far advanced. The tiresome skin and blood tests normally carried out for diagnostic purposes would offer no real solution in our case, so we decided against these. By pinpointing his food intolerances a change in diet was the first step, which was a real headache to begin with, but which is now part of our routine. The medication testing, which can be done using the device, was a good aid during therapy.

Although the individual stages were explained to us, I am not able to recount everything precisely. The device was used, for example, to resolve spinal blockages. A basic therapy then followed and the process of detoxifying the body was begun, which we will continue in the coming year (please excuse my oversimplified explanation of the process). In conclusion I would like to confirm that our son is now doing really well.

We have not regretted taking this step. On the contrary, we are very grateful for the help we have received. I believe that many patients can be helped in this way and I will continue to recommend this form of therapy.

People are often only interested in costs. We are by no means financially secure, but the experiences of the last few years have shown us that health is the most valuable thing we possess.

A. Bartikowski  
Rehmsdorf

# Children with chesty night-time coughs

## Are cuddly toys the culprit?

We have been working with Bicom therapy for just one year. In the case of allergy treatment in particular this method has superseded conventional methods in our practice. Patients are generally very satisfied with this therapy and through word of mouth the number of people who come to our practice just for Bicom therapy is growing all the time.

I find treating children the most rewarding aspect.

## Many of our small patients suffer from chesty coughs and sniffing at night-time.

Invariably they wake up several times and in the morning are not fully rested and are fractious. The cause of these symptoms are often enlarged pharyngeal tonsils – known as adenoids – or various allergies.

Before we started using Bicom it was often the case that children who had an adenotomy (operation to remove the adenoids) felt better in the short term, but the chesty cough remained.

Conventional allergy diagnostics, such as serological IgE determination or a prick test tested normal for older children and paediatricians or lung specialists were also unable to find any discernible causes for the illness.

Through bioresonance therapy I am able to ascertain what could be the cause of the chesty cough at night. Mostly it is caused by a house dust mite allergy and less commonly an allergy to pets or moulds.

## It is interesting to note that many a time there is an allergic reaction to toy polyester.

Many cuddly toys contain these small polyester balls. For every initial check-up I ask patients to bring along everything that their child sleeps with in bed at night. Three sessions are generally sufficient to treat a polyester or house dust mite allergy to bring an end to coughing and sniffing at night-time.

The parents are grateful and satisfied that their children and they themselves are able to comfortably sleep through the night.

The best thing for me is to observe children during treatment. If they are very reserved and anxious to begin with, they become more and more relaxed and happy over time.

**I can only say that Bicom therapy has closed what used to be a very frustrating gap in treatment in our practice.**

These success stories are the best confirmation for me that we are doing something right with Bicom therapy.

Dr. Franz  
Weinheim practice  
Autumn 2005

# Bronchitis

## Tracking down the hidden causes of illness...

I have been working with bioresonance therapy for the last four years and I am always surprised by how much can be achieved. My three Bicom devices have certainly been well utilised. I carry out testing with a biophysical test procedure and I am sometimes amazed by the test results, as they don't appear to match up with the condition. Often patients are amazed about the various correlations too. The following treatment, which does actually work, proves me right in such cases.

This was true of the following case, for example.

A father brought his 7-year-old son Nils, who has Down's Syndrome, to my practice because he was suffering from persistent bronchitis. The father felt helpless because the paediatrician had already prescribed three courses of antibiotics. He showed no signs of improvement after taking the tablets, however.

I tested using the programs which matched his symptoms for bronchitis, chesty cough, cold and programs to support his lungs, but all these programs tested negative.

When I tested using the 5 element human test set with the aid of the Bicom device, the 'heart' ampoule was indicated in the fire element. I tested this a further two times with the same result. I told the father my findings.

He was really surprised and also impressed. He told me that a few years previously a lung specialist had diagnosed heart problems, but that no treatment was administered at that time.

In two treatment sessions I treated Nils with the pre-stored programs to strengthen the heart, namely 'support for cardiac activity' and 'heart-meridian flooding.' Unfortunately we only had time to carry out two therapy sessions, because Nils lives in Holland with his parents and was only visiting our area.

One week after the second Bicom treatment his father phoned and told me: "Nils is now starting to get much bolder. I barely recognise him now." Later I learned that he was progressing really well. There had been no recurrence of his bronchitis. His mother also explained that his health was now much more stable.

I am sometimes surprised about just what I can achieve with this therapy method. Test results enable us to progress with the correct therapy plan and provide us with options that were previously unavailable to us. Some patients even call me Miss Marple, because I am always discovering new correlations and can track down the hidden causes of illness.

Naturopath

# Eyes

## Eye inflammations caused by allergies, viruses or bacteria

In my experience I am able to achieve better results with bioresonance therapy for many illnesses than I can using other methods.

Allergy therapy is a very important area covered at our ophthalmology practice. Above all with bioresonance therapy we have the opportunity not only to suppress symptoms with eye drops, antihistamines or cortisone medication, but also to remove the allergy completely.

Almost every patient looking to get their allergy under control with desensitisation ends up at our practice sooner or later to be treated with bioresonance and are then impressed by the rapid improvement in their condition.

Every eye specialist should buy a Bicom device in order to provide effective help to patients, particularly during the pollen season, because it is possible to make real progress in treating allergies using the Bicom.

We also treat eye inflammations which are not caused by allergies with the Bicom device. Often they are caused by a viral stress, e.g. through Herpes or other viruses. This is quick to test and treat using the Bicom.

The same also applies to bacterial stresses, particularly Chlamydia trachomatis, which are the main cause of conjunctivitis.

Dry eyes are also easy to treat and treatment is generally successful. I recall a patient who was complaining of dry eyes. This was caused by an inflammation of the lymph nodes, known as sarcoidosis. We were also able to help this patient using Bicom therapy.

Dr. med. A. Kuchenbecker  
Ophthalmology practice.

# **General/infectious diseases/warts/stomach/intestine**

## **23-year-old patient**

### **For 10 years his hands were covered in coarse warts**

In addition to allergy therapy we also use the Bicom device for a number of other indications. One example is a 23-year-old man came to our practice. For ten years both his hands had been covered in coarse warts. He suffered greatly as a result and felt embarrassed, but no dermatologist had yet been able to help him.

A colleague of his, who was undergoing treatment at our practice for an allergy at the time, recommended that he try bioresonance at our practice. Initially we weren't sure whether we could improve the condition of his skin, but we wanted to at least try, because it looked really unsightly.

I applied the program for treating warts indicated in the Bicom therapy handbook. After the first treatment the warts had already started to change.

He came three times at two-week intervals for treatment, but the warts appeared to be getting bigger rather than smaller.

When he came to our practice for the fourth time, he told us that he had showered the evening before and suddenly all of the warts had disappeared. They simply dropped off while he was showering. He didn't need any further treatment. The last treatment was two years ago and since then he hasn't had any more warts.

These cases are just two of many successful treatments completed.

**Almost all patients come to us as a result of word of mouth and often come from far and wide to be treated with bioresonance in our practice.**

# Mononucleosis and its consequences

## After two years of suffering, finally a return to good quality of life

On 15.5.2002 a 19-year-old female patient came to my practice for the first time. She told me that she was suffering from acute mononucleosis. This was only detected at a late stage and therefore brought a number of considerable health implications, which to date included:

increased susceptibility to infection, with acute symptoms such as sinusitis, tonsillitis, laryngitis, pharyngitis, swelling of the lymph glands and increased tinnitus.

This also caused infection in the bronchial region with intermittent and severe bouts of coughing and asthmoids. These were induced by changing viral infections, but also infections caused by mycoplasma and Chlamydia pneumoniae.

It was accompanied by recurring bladder inflammations as well as various fibromyalgia-related symptoms and an interrupted sleeping-waking rhythm, diagnosed as Chronic Fatigue Syndrome.

In 2002 she suffered a severe allergic reaction with hayfever and bronchial asthma. The patient couldn't continue her studies because her physical symptoms combined did not allow her to lead a normal life anymore and she was virtually bedridden.

Extensive testing with the Bicom device revealed a clear stress through the Epstein Barr virus. I also tested Chlamydia and mycoplasma.

The antibiotics that the patient had received when her acute disorder first manifested itself and the psychotropic drugs which she had been prescribed in various doses, were causing a stress. She also had an excessive reaction to a flu vaccination, which was applied during her illness as well as a focal stress caused by a retrotonsillar process.

A long-term immunological stress explained these symptoms.

The therapy procedure was as follows: based on the current symptoms displayed, programs stored in the Bicom were applied e.g.: programs to activate the lymph nodes, to regulate the mucous membranes in the paranasal sinuses and bronchial tubes, to increase resistance, anti-viral therapy and programs to dissolve energetic blocks, to activate the metabolism and increase vitality. We worked exclusively with the Bicom device in the practice. Complementary medication took the form of preparations for symbiosis control to stabilise the intestinal flora, orthomolecular substances and vitamins.

Happily, her chronic throat and paranasal sinus symptoms quickly improved, as did her general physical condition.

After the general state of the patient's health had improved, a targeted elimination of the antibiotics and psychotropic drugs was carried out using the Bicom device. This was followed by treatment for the Epstein Barr virus and the other pathogens (coxsackie virus, Chlamydia, mycoplasma infection).

The treatment took several months in total, because of the severity of the clinical picture and the multifaceted nature of the stresses.

The patient has a completely different quality of life as a result of the bioresonance therapy. She was able to repeat her exams and achieved top marks and today is still studying.

# Migraines with acute nausea and vomiting

## Cow's milk as the main trigger?

There can be a number of causes of migraines. Problems in the cervical spine region, hormonal disturbances and food allergies are just some of the triggers for migraine attacks.

During my years of experience as a Bicom therapist I have discovered that, particularly in the case of migraines which result in acute nausea and vomiting, there is generally a milk intolerance present and this can even be the main trigger.

This was the case for a 35-year-old woman, who came to my practice at the start of the year because of her migraine attacks. She suffered terribly from the attacks, because she was constantly vomiting and couldn't keep down any painkillers.

I tested her for an intolerance to cow's milk. Five Bicom treatments at weekly intervals with a strict abstinence from cow's milk have freed her from her migraines to this day. She can now enjoy eating her favourite cheese again.

I supported the cow's milk allergy treatment with corresponding Bicom programs for the intestine and liver elimination organs. The patient received her last Bicom treatment half a year ago and has not had a migraine since.

**In the past year I have used Bicom therapy to successfully treat around 40 patients, ca. 90% of whom were women and 10% men suffering from migraines accompanied by nausea. After a maximum of six treatments - and in some cases only two treatments were needed - these patients were free from their migraines.**

There are a number of different types of migraines, including those that do not cause nausea and for which cow's milk intolerance isn't one of the main stresses. Here it is very important to investigate the cause and this is made significantly easier with the Bicom device.

But it isn't just migraine patients who are delighted with bioresonance therapy. I could list any number of other cases which I have successfully treated with Bicom therapy.

# Dyspepsia

## **Italian patient: able to enjoy eating spaghetti again after 30 years...**

Since March 2004 we have been using bioresonance therapy in our practice. It is very rewarding because we can see the way in which it can help more and more of our patients.

This was true of an Italian patient, who had been suffering from dyspepsia for more than 30 years. His symptoms got progressively worse year after year. Some time ago he had stopped eating his beloved spaghetti with a glass of wine and followed by a small grappa, because he could no longer tolerate them. Since then he was unable to eat very much at all and looked extremely emaciated.

### **During this first visit with the help of the Bicom device we identified a pronounced wheat and cow's milk intolerance.**

For eight weeks he was treated every week with the stored allergy programs. During this time the patient consciously avoided eating products containing wheat and cow's milk. He got better week after week until at the end of the therapy, i.e. eight weeks later, he was cured.

As a small thank-you he invited me to an Italian restaurant around the corner and for the first time in a long time was able to really enjoy a spaghetti bolognese and drink a glass of wine. He really enjoyed the food. Once back in Italy he lit a thank-you candle for us and Bicom therapy in the village church and still speaks of it as a miracle.

Winter 2004

# Crohn's disease

## After 8 years of suffering, help received through BICOM bioresonance

A young gynaecologist who works in the hospital came to my practice, because she had been suffering from Crohn's disease for the past eight years.

She had severe recurrent bouts of diarrhoea containing mucous and blood and violent pain in her intestines. The diagnosis of Crohn's disease had been confirmed by means of endoscopy and x-ray. At the start of treatment she took cortisone tablets.

As a practitioner of conventional medicine she was unfamiliar with naturopathic treatment methods and in particular bioresonance therapy. However, she continually observed how midwives in the hospital successfully treated pregnant women with acupuncture and homeopathy.

She came to my practice on the recommendation of a colleague. Testing with electroacupuncture after Voll revealed that as well as a cow's milk and wheat allergy, she also had a Candida stress as well as mercury poisoning through amalgam.

The allergies, the intestinal fungi and the disrupted stomach and intestinal flora were treated at weekly intervals with bioresonance therapy. At the same time the amalgam was removed. In order to build up the intestinal mucous membrane again, I prescribed treatment using natural intestinal symbionts.

After the first treatments her symptoms were much better and the cortisone doses could be reduced to a minimum. After around 15 treatment sessions the patient was virtually symptom-free and able to eat almost everything once more without any problem.

As a paediatric naturopath I treat a large number of children in my practice. The treatments are therapeutically more straightforward, because children react much more quickly and vigorously to regulating measures such as bioresonance therapy and have hardly any blocks present, if at all. Children's bodies are also able to regenerate much more efficiently than adult bodies.

Apart from paediatric medicine, the main areas that we treat with bioresonance therapy in my practice include allergies, hayfever, neurodermatitis and chronic inflammatory intestinal disorders.

Naturopath and Paediatric Naturopath, Dreieich  
Spring 2004

## Finally after 13 years:

### Improved liver values

A 52-year-old female patient was suffering from chronic fatigue and recurring headaches. Her fatigue was so pronounced that it often required a huge effort on her part to look after the household and her family. Her professional life also suffered hugely as a result.

She had received help from her family doctor for the past 13 years and had to have blood taken four times a year because of her poor liver values. She came to my practice and said that her father had given her this treatment as a present and that she personally didn't really believe in it. She also intended to have blood taken again in the next three months and that would show her whether her values had improved.

I told her that I wasn't sure whether it would be possible to see any changes in the blood, but I reassured her that she would probably feel noticeably better.

After I tested using suitable programs, we started the Bicom therapy. I used the stored liver and gallbladder programs in particular, but also the circulation programs for the head and abdominal area. The patient felt better after each therapy.

After the 9th treatment she had an appointment with her GP for the routine blood sample. When she received the results, she called me excitedly and explained that not only had the treatments had a noticeable impact on her, but also that her blood count had significantly improved: Y-GT had fallen from 148 to 39, GOT had improved from 41 to 28 and the GPT value had fallen from 93 to 34. Now we had it in black and white. Her GP was amazed that after 13 years her blood count had improved so drastically and could not comprehend the improvement.

## Decades of suffering from ice-cold feet

### Successful treatment convinces sceptical scientist of its efficacy

When I decided to start using Bicom bioresonance therapy in my practice, my father was really annoyed and reproached me for it. A retired maths and physics teacher, he simply couldn't accept that his daughter could spend money on "vibrational medicine." He thought it was a lot of humbug.

I was not to be deterred though and one of my first patients was my mother, who suffered from permanent shaking, similar to Parkinson's. After three Bicom treatments my mother was visibly better. My father noted this change with incredulity and one day asked in passing what I would do with this device for his permanently cold feet.

My father has suffered from ice-cold feet since he sustained a war injury, when he was shot in both knees. I replied that I would first need to treat his scars with the 'scar elimination' program already stored in the Bicom. To my complete amazement he said: "Ok then, let's do it." I told him that he would probably not feel any improvement after the first treatment, because the injury was so old.

I treated his scars with the Bicom and then applied the 'circulation of the lower half of the body' program.

Two days later he called me and told me, in a completely bewildered voice, that for the first time since the war he had warm feet again.

He was overjoyed! Now he also wanted me to use the Bicom to treat his trigeminal neuralgia, which he had been suffering from for more than seven years. We managed to get this under control too with bioresonance.

**He is now a complete convert and is fully behind this therapy. Recently he told me: "If I wasn't 90 years old I would take up bioresonance as a career ..."**

He is fascinated by this therapy, tells everyone his story and at the age of 90 is learning with great interest about the biophysical background to bioresonance therapy.

## Undimmed joy of motherhood after

# Breast inflammation, blocked milk ducts and suppurating nipples

Unfortunately motherhood is not always without its problems. I thought that breastfeeding would be the most natural thing in the world. But shortly after the birth of our little daughter Lena I found out otherwise. From the very start Lena was an enthusiastic and quick drinker and if the milk did not come out straight away she would bite hard with her little gums.

I clenched my teeth until I was only able to offer my daughter my breast with tears in my eyes. The midwife told me that it would be better after a few days of becoming accustomed to it. But because of all the sucking and biting, my nipples were extremely inflamed by this point and began to suppurate, causing my milk to stop. What happened then was a total crisis for me.

My milk would not flow, everything was inflamed and my breasts were getting harder all the time. I was unable to raise my arms anymore because the tension and pain in my chest was so great. My midwife tried with all the options available to her to ease my pain: homeopathy, quark poultice etc. ... Nothing helped. In the meantime I had also developed a temperature of 40 degrees for the past two days and could not get it down. I had to express the milk, because my milk was being infected with bacteria as a result of my suppurating nipples. In the interim Lena was being given goat's milk in a bottle. What a great start to motherhood! After three days my midwife had no more advice to offer and sent me to a gynaecologist. He was really shocked and advised me to stop breastfeeding straightaway and on the same evening to start taking a high dosage of antibiotics. He warned of the risk of an abscess on the breast which, if it developed, would have to be removed surgically.

But stopping breastfeeding was the last thing I wanted to do, even though I was worried about a potential abscess. Instead of going to a pharmacy to get antibiotics, I went to a naturopath who was experienced in the area of bioresonance therapy. She was sorry that I had not come earlier, but was prepared to treat me with bioresonance. She did stress, however, that I would have to take the antibiotics if there was no immediate improvement in my condition. I also had to promise her to inform her about progress with my condition at regular intervals.

The naturopath treated me with the Bicom program for mastitis. I was then treated with another lymph program.

I could now raise my arm without any pain in my chest. The next day my nipples were no longer suppurating and my temperature fell. My midwife could scarcely believe it when she visited me the following day. On the following two days the naturopath treated me with the same programs. During the treatment the blocked milk started to flow again, my breast became softer again and the cracks in my nipples visibly healed. To achieve such success with just three Bicom programs was unbelievable.

I threw the prescription for antibiotics in the wastepaper bin and 1 week later I was able to breastfeed Lena again for the first time. That was 4 months ago and when I look at my small daughter breastfeeding and how much she enjoys drinking and sucking, I am delighted that thanks to Bicom therapy I didn't have to stop breastfeeding.

I truly hope that gynaecologists and midwives have the opportunity to learn about and use bioresonance therapy, in order to help mothers and their babies in a gentle and simple way.

C. Werner,  
Patient from Munich

## Gynaecology:

### From mycosis treatment to endometriosis therapy

Most of us gynaecologists are biased towards the use of conventional medicine. If there are anomalies in the menstrual cycle or dysmenorrhoea develops we generally prescribe hormones straightaway, even though many hormonal imbalances can occur as a result of heavy metal stresses and so on.

This is why I have always been interested in offering naturopathic treatments in my gynaecological practice too. In addition to homeopathy and acupuncture I have now been offering bioresonance therapy for the past six months – with great success. Because with bioresonance therapy I am approaching the disorder from a completely different standpoint and can look into the real causes. This is the most important aspect for me.

In the case of mycosis, which is one of the main problems in a gynaecological practice, Bicom therapy has been proven to produce the best results. I am not able to help my patients so effectively for vaginal yeast infections, for example, using conventional medicine. I can prescribe a few Clotrimazol pessary treatments, but this is just a localised treatment, which only brings short-term improvement, because the fungal infection simply passes from the rectum into the vaginal area again.

Mycoses need to be treated systemically. The programs stored in the Bicom value are invaluable for this. Often heavy metal and parasite stresses are linked to mycoses. I can also test these with the Bicom and treat accordingly. The use of therapy programs is incredibly simple.

But it isn't just mycoses and other stresses that can be treated with the Bicom device, as the following case demonstrates.

A young pregnant patient came to my practice with confirmed endometriosis. From the first day of her pregnancy she experienced pain in the right hand side of her lower abdomen. She had attended the clinic four times because of this and neither my colleagues nor I could determine whether the pain was due to the endometriosis or because of a serious pregnancy-related problem. An acupuncture treatment brought some short-term relief, but the pain returned the following day.

With the endometriosis nosode from the Bicom Multisoft program (software program for digitally stored substance information) I treated my patient, who was now in her 22<sup>nd</sup> week of pregnancy. After just one treatment she was pain-free and remained so until the birth of her little daughter. This was a surprising and very welcome outcome for me too.

Dr med. P. Dehm  
Gynaecologist, Ettlingen

## Gynaecology

### Childless for so long - then finally a baby!

Unwanted childlessness is a problem for more and more couples. Generally advice and treatment in cases of unwanted childlessness is limited to human germ cells and biological correlations. What remains is often an extreme psychological stress, which normally affects women.

They suffer terribly because of this situation, are ashamed and have often exhausted all other possibilities. Years of experience have taught me that in many cases treatment with Bicom therapy can help patients become pregnant. For example, mycoses, geopathy or radiation stress, scar interference fields, toxic stresses or years of taking the contraceptive pill can prevent a woman becoming pregnant. But an intolerance to their partner's sperm may also prevent this from happening.

My last baby success was not that long ago. A 34-year-old woman had already undergone numerous check-ups using conventional medicine and organically speaking everything was fine with her and her husband. The couple had decided to give Bicom therapy a try as one last throw of the dice. After taking a detailed medical history test results revealed: mycosis stress (1 million germs!), vaccination stress (rubella and tetanus), cow's milk, and wheat allergy, stresses caused by amalgam, wood preserver and formaldehyde. We began treatment straightaway. Her joy and amazement knew no bounds when the patient discovered that after a total of eight Bicom treatments she had become pregnant. Ten months later their new addition was born by C-section.

After my first info evening on this topic in my practice it was clear what a taboo subject I was dealing with. The problem seems to be so widespread and the Bicom therapy options are so effective. The birth of a little Bicom baby makes me so happy every time. I am really proud that I have been able to do my part in bringing a new life into the world.

Rita Doll  
Bicom Therapist

## Gynaecology

### Happy patient: from PAP IIIId to PAP II

During Ms. B.'s cancer check-up with her gynaecologist changes were discovered in her portio vaginalis.

**A tissue sample was taken and a PAP test confirmed that the changes were in the marginal IIIId stage.**

This marks the transition to carcinoma. Trigger factors could be numerous condylomas (vaginal warts), which were considered a pre-cancerous viral disorder, according to the gynaecologist. Elimination of these condylomas did not bring about any improvement and they returned after a while.

With this history Ms. B. came to my practice in quite a depressed state. I tested using a virus nosode ampoule and the condyloma virus was detected as stressing the body acutely.

On the same day we started with the bioresonance therapy. As is the case for every patient, I always start Bicom treatment with an individual basic therapy in order to prepare the body for the subsequent therapy programs. Before eliminating the virus I strengthened the immune system with programs already stored in the device. I then began eliminating the condyloma virus, also using the Bicom device.

For a period of twelve weeks Ms. B came at weekly intervals to my practice and time and again we eliminated the virus and strengthened the body's own resistance using bioresonance therapy.

The virus stress become weaker and weaker, but was still marginally present up to the eleventh Bicom treatment. After twelve treatments my patient went for a check-up with her gynaecologist. He was very surprised to see that there were no longer any condylomas present. There was even more amazement when the results of the latest PAP test came back:

**in just three months her results had improved from stage IIIId to stage II.**

The patient was delighted with this result. This was two-and-a-half years ago and there has been no recurrence.

Dr med. Ulrich Teschke, Specialist in General Medicine,  
Oldenburg

## Gynaecology

### From PAP IVa to PAP II Decision to choose alternative medicine

In January 2002 I went for a check-up with my gynaecologist. The usual smear tests were carried out and this revealed a PAP III value. The lab report made the following remarks: metaplasia, signs of a viral infection and moderate epithelial dysplasia bordering on acute dysplasia, but with no carcinoma in situ.

Of course I was extremely concerned with these findings. The doctor stressed that the tests would need to be repeated at regular intervals in order to keep a check on how it progressed. He did not want to start any treatment.

In April 2002 I had a further smear and this was sent to a different laboratory. This test also revealed the same findings as in January. At least the values had not got any worse. From test to test I hoped for an improvement in the value. But this was all in vain and on the contrary, the test in August 2004 revealed a PAP IV a value and the assessment was: acute dysplasia of the portio mucous membrane.

My gynaecologist recommended surgery in the form of a biopsy of the cervix, known as cervical conization. Now I was really worried. An operation on my uterus? At my age? I was only 25 years old after all, and wanted to have a family. The gynaecologist I was assigned to stressed that the operation to stop cancer developing could not be avoided. This unsettled me greatly. Although the doctor reassured me that it was a harmless procedure and that I would still be able to have children, I was worried about having an operation at all. Particularly because I had heard that if there were cancerous cells present an operation could lead to the cancerous cells being spread.

In my distress I turned to an experienced bioresonance therapist. I was tested using the Bicom device and various test sets. The therapist told me that she was prepared to treat me, but stressed that there was a time limit on the procedure and with the proviso that in November I would have to have another PAP swab taken. If this test revealed an improvement she would continue with treatment. If this was not the case I wouldn't be able to avoid having an operation. I decided to go down this route.

First of all I received Bicom treatments at weekly intervals and later the time between treatments was increased to two or sometimes even three weeks. At the start of December 2004 the PAP test showed IIw. The gynaecologist explained to me that this indicated that only slight changes were present and the test result was almost normal. I was incredibly relieved. I continued to receive further Bicom treatments and the test on 14 April 2005 revealed a clear PAP II value.

I cannot find the words to describe the feeling of relief. It was as if the sword of Damocles had been hanging over my head for the past few months and had now disappeared. What a feeling of happiness and gratitude!

I had never really given a lot of thought to my health or medicine. I had also never thought that I would be faced with the question: conventional medicine or alternative medicine? I can say today with total confidence that it is a blessing that bioresonance therapy exists.

Patient K. Titz, Munich

Editor's note: In response to an enquiry by Regumed the patient reported in September 2010 that she has been having regular check-ups every 6 months for the past few years and the laboratory still confirms she has a PAP II value.

## Gynaecology

# For years recurring inflammations in the vagina and in the true pelvis

### Resistant pathogen successfully treated and as a result renewed pleasure in 'conjugal duties...'

In my gynaecological practice I use Bicom therapy for treating various disorders. Particularly for stubborn disorders, where it was previously not possible using conventional medicine to help my patients overcome their symptoms, Bicom therapy has proved to be a very valuable treatment option for me.

One example is a 41-year-old female patient of mine, who suffered for several years from a recurring inflammation of the vagina and in her true pelvis, caused primarily by pathogens such as Gardnerella vaginalis in combination with Staphylococcus aureus, Streptococci, Escherichia coli. She also suffered from recurring Candida colpitis. She complained about discomfort and an amplified feeling of moisture in her vagina. In addition she experienced itching and pain during sex, which was putting a strain on her relationship.

In November 2001 she switched from her gynaecologist to my practice and we continued a treatment which we had already started at one point, with local and oral antibiotics to counteract the inflammations and to build up the intestinal flora again with Döderlein's bacteria. However, this only had a short-term impact.

The inflammations continued to appear at monthly intervals. Several hospital stays using intravenous antibiotics had little success. In September 2003 I tried to stimulate the immune system intramuscularly with three doses of Gynatren®. After a period when the symptoms disappeared, a new series of inflammations developed.

In April 2004 I began using Bicom therapy in my practice and recommended that this patient try it. I treated her with the programs stored in the Bicom device, such as programs to treat vaginal infections, mycosis therapy for a Candida stress and strengthening the immune system. After nine Bicom treatments at weekly intervals the patient was free of symptoms and there have been no recurrences to date. Regularly smears have also come back normal. Given the large number of similarly positive gynaecology outcomes, I cannot now imagine practising without this therapy option.

Dr. med. Ulrike Mwanguvu  
Gynaecologist, Marl  
April 2005

# Skin

## Urticaria

### Female patient: it is like starting over again...

Manfred Heggli, naturopath from Switzerland, passed Regumed the report for the then 17-year-old Susanne Heer, a patient he had treated.

The patient wrote as follows:

#### Mid-January 2005:

"I hurt my knee while snowboarding. Various tests show that I have torn my meniscus. I'm given painkillers, but I only take a few of the tablets.

The day after taking the tablets I start to develop a rash: round, raised pustules filled with liquid (wheals).

The rash is very itchy, but bearable, because at this time I only have a slight rash (arms and legs, particularly around the knees and elbows). When the rash is still there after a few days I go to my GP and he prescribes antihistamines. The tablets start to take effect and I feel better. Diagnosis: acute Urticaria, also known as nettle rash.

#### End of January 2005:

Time to slowly come off the medication.

I have scarcely stopped taking the antihistamines when it all flares up again, only this time even worse.

The rash is spreading over larger areas of my skin. It is not there all the time - it comes and goes as it pleases. All thoughts about whether it could be an allergy come to nothing. I've no idea what I could be reacting to.

So, back to the GP and he prescribes me trusty antihistamines again, but this time gives me a double dose.

But this doesn't have any real effect and after around ten days I'm given a cortisone preparation. This works and the rash disappears completely. Then it's time to slowly come off the medication, and after a few days it's the same old story: itching wheals, particularly on my arms and legs. Back to the GP, who gives me a stronger dose of cortisone, which no longer has any effect, even while I'm taking it.

## **End of February 2005:**

This whole episode has now lasted six weeks already, which my GP says is very unusual. This is no longer acute Urticaria – it's chronic.

The medication doesn't help, the GP has run out of ideas and so he refers me to a specialist.

First appointment with the allergologist. Diagnosis: Urticaria. Nothing new there. This doctor also prescribes me antihistamines – again nothing new.

The new antihistamines only improve the rash slightly and I stress 'slightly.' When I wake up in the morning I am usually covered in wheals on my legs and arms and it's getting worse.

## **March 2005:**

This whole situation is unbearable.

The allergologist prescribes me new medication, which doesn't help either. I have since developed an extremely itchy rash on almost all of my body – very unpleasant! If you haven't experienced this, it's hard to imagine what it's like when your entire skin itches and also burns as though it's on fire. You end up scratching yourself half to death. When I'm sleeping I scratch my arms and legs until they bleed, because the itching is much more extreme at night.

Neither medication nor special ointments nor special bath lotions bring any relief.

Suddenly there is also swelling as well as the rash: at first only puffy hands and legs, then suddenly my face and lips start to swell. Since February I have rarely been to school, partly because I feel so bad and partly because I scarcely dare leave the house ...

I am increasingly experiencing respiratory problems, which makes me feel as though my windpipe is constricting.

In the evenings my upper lip suddenly swells up and I feel like I can't catch my breath and start to panic. My mother immediately calls a taxi and I'm taken to A&E. I'm injected with cortisone and other medication.

I am then placed in intensive care, where I have to stay one night and one day. The doctors recommend that I explain everything to the allergological department of the University clinic.

So, after coming back home I have my first appointment at the Uni clinic. A nice doctor explains a few things to me and then prescribes new medication. At the same time I have another appointment with a homeopathist. She tells me: "You are really not well and you look awful." But that doesn't get me any further either, as she tells me that I first need to undergo various allergy tests in the University clinic in order to find out what I am allergic to before she can help me. The tests cannot be carried out, however, because I cannot stop taking the antihistamines.

It is a vicious circle which I simply can't break.

### **Up to and including October 2005:**

It is now more than half a year since I first developed wheals. In the meantime I have become a regular at the Uni clinic, have undergone various tests and have a long history of a variety of medication behind me – and despite this I'm actually feeling worse.

Despite the strong medication (which I take in high doses) I cannot rid myself of these symptoms.

Stopping the medication isn't an option, is too risky and I would simply end up back in intensive care. I often feel dizzy and sometimes this even leads to blackouts. My ability to concentrate is non-existent, my general health is suffering – no wonder, since the strong medication is having a huge impact on my organs and immune system.

I sometimes feel that I can't go on. I am also trying out a faith healer. He lays his hands on me twice and tells me I'm now cured. Great, I think, but this doesn't work either. Despite numerous absences, with my last ounce of strength I manage to pass my school leaving exam.

### **November 2005:**

I start studying to become a vet - something I have been looking forward to for years. But I no longer have any strength to fight, I can't concentrate during lectures and I am becoming desperate. I no longer have the strength or energy to really get to grips with my studies. My body can no longer cope with it all.

### **December 2005:**

An aunt of mine, who works as a midwife and uses homeopathy, suggests I try out Bicom bioresonance therapy. No sooner said than done! My mother looks online for a naturopath who works with bioresonance: Mr Heggli. She arranges an appointment for me. At the first appointment I am given a thorough examination and check-up.

The tests reveal that I primarily have an allergy to milk, wheat and eggs, but also to other substances.

From now on I attend a weekly session with Mr Heggli using Bicom bioresonance therapy. At first there are basic things to sort out, detoxication and so on.

Amazingly, after just two bioresonance treatments I suddenly feel much better and don't need to take the full dose of my strong medication (antihistamines) every day. This is practically a miracle in my eyes, when you think that for more than half a year I've had to take very high doses of strong medication.

We continue the treatments. After around four to five therapies I only use the medication sporadically, perhaps two to four times a week, and at a much lower dose.

Mr Heggli then suggests that I try a boiled egg to see how I react to it. I should point out that we still hadn't started egg allergy treatment at this time. And lo and behold: the following day, as predicted by Mr Heggli, I have an all-over rash again – proof of the presence of an egg allergy. Good, this means it's worth treating the egg allergy. At the same time, a Candida fungal therapy is also carried out with Bicom and accompanying abstinence from sugar.

## January 2006

From January 2006 I no longer need to take antihistamines and am free of symptoms. Now my body is built up again with various homeopathic and plant preparations. It will take some time until my body has fully recovered from the influence of the strong medication.

In summary I would like to say that after the tests and treatments by various doctors and specialists in conventional medicine, hospitals, a homeopath and a faith healer, Bicom bioresonance therapy is the only thing that has helped me become healthy again!

Mr Heggli has given me back a normal life and I am so grateful to him for that."

Susanne Heer

# Unable to work, with mobility problems caused by extremely inflamed and painful legs

## Patient no longer believed that she could be helped

I have been working since 1990 as a naturopath, particularly with the Bicom device.

One day a 30-year-old woman came to my practice. She could barely walk and when I examined her it was clear why. On her legs she had almost no skin – it had just become one big inflammation. Her pain was so acute that it looked as though she had a mobility problem when she walked.

She had been experiencing these symptoms for around two years and had such pain that she could no longer work. She had been from one therapist to the next and every one said something different. One believed that house dust mites were the cause while another tried, unsuccessfully, to treat her for a vaginal fungal infection. With a biophysical test procedure within a few minutes I had discovered the true cause of her symptoms: mycosis.

I treated the mycosis with the mycosis programs stored in the Bicom device and strengthened the elimination and detoxication organs with the corresponding programs. In addition I ordered her to abstain from fruit, sugar and yeast for three months. After three weeks there was a significant improvement and after eight weeks the symptoms had completely disappeared and the patient was pain-free. That was two years ago and she is still free of all symptoms.

This patient hadn't believed that I could really help her and I was surprised myself that it was so straightforward.

Austria

# Extreme skin reddening on the face for 20 years

## Stress caused by wood preserver

One day a patient came to me who had been suffering from a very red face for more than 20 years. His nose in particular was extremely red.

The test with the Bicom device revealed an acute stress caused by the wood preserver Xyladecor. When I told him about the test results he recalled that as a 14-year-old boy he had to paint the garage door with Xyladecor. He had then spent a week in bed feeling very unwell with nausea, vomiting and circulatory problems.

No one made an immediate connection with Xyladecor poisoning at the time. But this experience was so severe that he immediately recalled it when he heard about the Xyladecor stress.

I twice eliminated the Xyladecor with the Bicom device four days apart. His face resumed its normal skin colour within a few days. The reddening had completely disappeared. For me it was a new experience to see that an environmental toxin stress could cause such an intensive reddening of the skin.

Tuttlingen

## Skin

### 5-month-old baby:

## Neurodermatitis in its worst form

In my practice I treat many children, but I had never seen anything like this. The skin of this five-month-old little girl brought into my practice was just one big mass of eczema. Neurodermatitis in its worst form.

**The skin was really thick, leathery and acutely inflamed.**

Ointments were no longer absorbed by the skin. Using a biophysical test procedure and the Bicom device I tested several allergies. The main allergen was cow's milk.

I treated these with the stored allergy programs. But this only brought about a slight improvement.

During the fourth treatment the mother explained to me that four years earlier she had a serious motorbike accident and had to undergo several operations. I seized upon this information straightaway.

Bicom testing revealed that not only the mother, but also her small daughter had been acutely stressed by the anaesthetic. Gradually we eliminated the anaesthetic from the child at weekly intervals with the corresponding therapy programs and afterwards we were able to successfully tackle the allergies. The child got better from day to day. Overall we carried out treatment for four months until the child was completely free of symptoms.

**The skin changed noticeably to give her a soft peachy baby complexion.**

The little girl's entire constitution improved from visit to visit. I finally treated her at four-weekly intervals in order to stabilise the immune system further.

The little girl has now been free of symptoms for more than six months.

This reminded me again just how important a thorough medical history is when trying to uncover background stresses.

Incidentally, I treat my little patients while they sit on the floor and build Duplo towers. This is possible because the therapy is so easy to apply – a practical electrode arrangement which gives the child freedom to move around and above all because the therapy is absolutely painless.

This means that a visit to the practice is completely relaxed and stress-free for both the child and the parents.

### Baby with persistent skin rash

#### A mother reports

When our son Dominik was only three months old, he developed a stubborn rash starting at his forehead and running down the side of his face to his neck. The paediatrician believed that it was a special case of baby acne. He said that it couldn't be anything serious, because I was still breastfeeding all the time. We treated the skin with greasy ointments, but this didn't help at all.

A few weeks later I took my baby to a dermatologist. She had the following to say: "If you are still breastfeeding all the time it cannot be neurodermatitis." However she did prescribe my little boy with an ointment containing hydrocortisone. This was said to have no side effects for the baby. The rash subsided, but the skin was still like paper, yellowish and thin in the places where it had been treated.

I found another dermatologist. His diagnosis: neurodermatitis. I was still breastfeeding all the time at this point. He gave us a preparation with hydrocortisone. Nevertheless, he suggested that if I wanted to, I could try abstaining from all dairy products. "But parents who need to keep their children from eating certain foods know how difficult it is to change their own and their child's diet and it is not a long-term solution, because you would just go crazy," he confirmed.

#### **Parents who need to keep their children from eating certain foods know how difficult it is to change their own and their child's diet.**

I stopped breastfeeding in the meantime and the biggest problem was now keeping everyone else from treating my child to cakes, biscuits etc.

Dominik was just one year old and I was more or less with him the entire day, but how would it be at the nursery? In fact it turned out that strict abstinence from dairy contributed to his skin looking less healthy. Now his elbows, pubic area, back of the knees and lower legs were also affected. It was worse on hot days than on colder days.

When Dominik was around 1 1/2 years old a friend told me that a colleague of hers had a stubborn patch of psoriasis on her head for some years and had finally been cured by a naturopath. After we obtained the address, some 25 km from our home town, I immediately made an appointment and took my little boy there. What made me feel immediately positive was that there were mothers in the waiting room who were there with their second and third child for treatment. So, I reasoned, they could also possibly help Dominik here.

**... We were very sceptical, but we didn't want to leave any stone unturned ...**

We learned from the naturopath couple that they worked with bioresonance and we had to adhere to strict diets for a prescribed period of time, so that the main allergies could be treated with bioresonance. Now, if I am being totally honest, we were very sceptical, but we didn't want to leave any stone unturned.

And actually, Dominik became bonnier and healthier from session to session. The progress made was remarkable. After just half a year the treatment was complete, he could eat anything he liked again and to this day is free of symptoms. Today Dominik is 10 years old, still has rather dry and sensitive skin which needs to be looked after, but is otherwise healthy.

Incidentally, a GP in our area has since also started using bioresonance therapy. From other people I have also heard about other businesses nearby where patients can go for bioresonance treatment. The method appears to be gaining in acceptance, is successful and I am completely convinced of its efficacy.

# Skin rashes: for 10 years suppurating pustules all over body

### **A good feeling: being able to help chronically ill patients!**

For around four years we have been working with the Bicom device in our practice, because we were looking to expand our options beyond conventional medicine. From the outset we used it, tried it out and achieved good treatment results in this first phase.

For almost ten years a 30-year-old woman had been suffering from a skin rash across her entire body, consisting of nothing but small, suppurating pustules. It started off quite harmlessly, but over the course of the years became worse and worse. In the meantime the rash looked so awful that it was having a serious impact on her relationship: her partner was repulsed by it and didn't want to touch her anymore. None of the dermatologists that she visited were able to help her.

As a result she came to our practice. Using the Bicom device we identified various stresses and treated the patient at one to two week intervals exclusively with bioresonance therapy. Her skin gradually improved and after around ten weeks she came to my practice and told me proudly: "Look at me!" She was overjoyed, because her skin was radiant again.

There was a happy ending too: her boyfriend proposed to her! She is now happily married. She has sent her entire family to us for bioresonance therapy to treat various ailments.

### **Interestingly, colleagues who are pure conventional medical practitioners, or their assistants, have come to us for treatment with the Bicom.**

This includes a friend of ours who is a general practitioner. He called one day and said: "I have had diarrhoea for four days and can't get rid of it." He took me up on my offer and came to our practice, explaining that he had been taking antibiotics, but that they were not having any impact.

The test revealed a viral stress. I treated him with a virus program stored in the Bicom. On the following day he called, full of excitement and relief to tell me that the diarrhoea had disappeared. Since then he has sent me patients who he has been unable to help with conventional medicine, to undergo Bicom treatment in our practice.

A paediatrician from a neighbouring town also regularly sends children for bioresonance treatment. Particularly the very little ones, who she doesn't want to give antibiotics to, she sends to us. She has also referred some patients suffering from glandular fever. Incidentally, this disorder can be treated very effectively with bioresonance. We have already successfully treated 15-20 cases.

Patients overwhelmingly come to us as a result of recommendations; through this the catchment area for the practice is continuing to grow. We don't advertise; on the contrary, we are trying to slow down the influx. We are unable to treat any more patients than we currently do and we are already often working on Saturdays. Every day 10–15 patients come to us just for bioresonance therapy. It's no surprise with a success rate of around 90%!

Our main areas of treatment are: pain, viral and bacterial infections, allergies, lumbar and cervical spine problems, circulatory problems, pre- and post-operative treatments etc.

**From a scientific point of view the Bicom device is a bonus for our practice.**

To familiarise yourself better with bioresonance therapy, a basic training is recommended, because it enables the broad spectrum of treatment options to be fully exploited. The time invested is certainly worth it.

It is a great feeling being able to help patients who have suffered from chronic conditions over a number of years.

# Hyperactivity

## **Hyperactivity Fidgets and dreamers**

### **Treating AD(H)S with the BICOM**

In her naturopathic practice Jessica Rüter works primarily with children with behavioural difficulties. The main focus is children suffering from AD(H)D (Attention Deficit Hyperactivity Disorder). I gave a presentation on my experiences of this at the 2007 International Bicom Congress in Fulda. Here is a short recap.

Thousands of parents of nervous, unfocused and fidgety children are asking these very questions: disturbed or normal? Ill or just spirited? In need of therapy or just going through a difficult phase?

In treating children suffering from AD(H)S, Ritalin is always the drug of choice. Methylphenidate, the reactive agent in Ritalin, was originally used as an appetite suppressant and antidepressant which actually made young patients quieter and better able to concentrate. The effect it has on the brain is similar to the reaction experienced with a number of illegal amphetamines.

Unfortunately, no long-term studies have as yet been carried out to investigate the possibility of damage later in life or of any side effects. Many parents don't feel comfortable with giving their children medication of this kind and look for alternatives.

But there is much speculation about the cause of AD(H)D.

#### **Frau Rüter stressed in her presentation that this disorder was a metabolic disorder.**

She explained that during haemoglobin metabolism pyrroles arise as a result of physiological stress. They are catabolic products which are excreted via/with bile acid. The pyrroles and bile acid are stored together and detoxify each other.

Where there is a metabolic disorder present the pyrrole combines with vitamin B6 instead of the bile acid. This forms a Schiff's base which in turn binds with zinc acting as a carrier. The end product is kryptopyrroles. These children are therefore experiencing both an acute vitamin B6 and also a zinc deficiency. The kryptopyrrole stresses the liver in particular.

#### **It is therefore particularly important to detoxify the liver.**

This is carried out using the 'liver detoxification' program stored in the Bicom.

Her success with treatment proves that this metabolic disorder can be effectively treated with Bicom.

The following stresses have often been revealed by testing with the Bicom and are based on a metabolic disorder: heavy metals, antibiotics, food intolerances, oxytocic drugs and explicitly post-vaccinal stresses.

**Post-vaccinal stresses appear in the form of blockages that have such a strong effect on the entire metabolism of these children that symptoms such as speech disorders, restlessness, lethargy, problems with concentration etc. occur.**

The logical consequences of these symptoms are "changes in behaviour" in children. Testing confirms that most children have an insufficient detoxication function of the liver, kidney, lymphs and intestine. The corresponding Bicom programs are used in treatment, in order to stabilise the detoxication organs and to stimulate detoxication.

By employing the bioresonance method in conjunction with the 'vaccinations and heavy metal stresses' test set, the post-vaccinal blockages can be removed accordingly.

**Food intolerances are the most common stress alongside post-vaccinal blockages.**

The allergy programs stored in the Bicom are used to treat this.

In 70% of children a medication stress is also tested, caused by oxytocic drugs or painkillers. Heavy metals are also important. Medication and heavy metals are eliminated during treatment. Ms. Rüter treats children once a week. She reported that the overwhelming majority of children are much better after 3 – 4 treatments.

**Children are quieter and more motivated and their levels of concentration have improved significantly. Ms. Rüter has treated around 30 AD(H)D cases, with a success rate of around 85%.**

The length of treatment takes an average of 2 - 3 months depending on the number of stresses, which are treated once a week. Among the 30 children who have been treated there were also 10 who had been prescribed Ritalin. Ms. Rüter points out that naturopaths are not permitted to withdraw use of Ritalin, but that the mothers can. Even if Ritalin is no longer being taken, this information is stored in the body for a number of years. It is therefore important to eliminate the Ritalin.

**Jessica Rüter closes her presentation to the Congress with the words:**

**"I would like to encourage all therapists to make use of the fantastic possibilities offered by Bicom therapy for the benefit of their patients, both young and old."**

## **Hyperactivity 7-year-old girl:**

# **Hyperactive and permanently full of cold**

### **Success with Bicom therapy leads to waiving of panel status**

Integration of bioresonance in my practice worked really well. Many of my patients were already aware of alternative treatment methods. When I am no longer able to help patients with conventional medicine or other naturopathic methods I put my trust in bioresonance therapy.

**I now treat more than 50% of my patients with the Bicom device.**

I mainly treat allergies, chronic sinusitis etc. I have successfully treated over 100 allergy patients with the Bicom, including a number of food and pollen allergies. Our success rate is over 90%.

By using bioresonance in my ENT practice I have changed the focus of my work: **I have a lot more problem patients than previously. The good thing is that I am now in a position to help them.**

The success achieved with the Bicom device allowed me to give up my panel doctor status in 2006. I make a very comfortable living and I work now in a calmer environment with greater success and that is very satisfying, both for patients and for me as a therapist.

### **Here is a typical case study:**

7-year-old Julia was hyperactive and always full of cold all year round. Although she is a very clever girl, her scholastic achievements leave a lot to be desired. She was treated for a number of years with antibiotics, but without any appreciable success. Then she came to my practice. I tried first of all with homeopathy, which brought about some improvement, but there were always relapses.

Then I decided to treat her with Bicom. I tested with a biophysical test procedure and discovered that she was allergic to milk, wheat, rye, eggs, pork, sugar and a few other substances. The Bicom treatment lasted some months, because of several longer holiday-related breaks. Julia continued to improve. Happily her schoolwork also improved greatly. Now she is an A-grade student in her grammar school. Her parents were really relieved and very happy.

## Musculoskeletal system / Neurology

### Serious complications after the birth

**The parents: “We wish that this therapy was also available to other children”**

Marleen

Our daughter Marleen (see photo) was delivered by caesarian section six days before her due date on 8 June 2001 due to breech presentation. As soon as I saw Marleen I knew that something wasn't right. She wasn't crying, which you always imagine they will. She was also taken away straightaway. I was really worried about her. Marleen was given oxygen, placed in an incubator and sent to intensive care. This is not the way we imagined the birth of our first child.

When I visited our daughter in intensive care for the first time I was horrified. Her little body was covered in cables. She even had needles on her head. She cried a lot and was very difficult to pacify. She also had to be administered oxygen. Gradually we were told about the symptoms/signs of illness Marleen was showing.

Breathing difficulties with need for oxygen because of shadowing on the pulmonary lobe, two luxated hip joints, constricted spinal canal, scoliosis, left knee could only be bent 90 degrees, stiffened hand joints, limp muscles, weak motor system, reduced mobility in arms and legs. Because of the shadow on the lungs Marleen was given antibiotics straight after the birth. This did not bring about any improvement, however, and instead caused a stress to develop on her intestine.

For 3 weeks our little daughter was in intensive care and needed oxygen just to survive.

There were no signs of improvement. We were despairing and realised it couldn't go on like this.

On 29 June 2001 we started Bicom therapy. On 30 June Marleen was moving her arms and legs around a lot more. She was now being treated every day with Bicom. On 1 July her left knee no longer showed any resistance and from this point could be bent to her bottom. Her hands were looser. On 3 July the nasal cannula used to provide her with oxygen was removed. Her breathing had stabilised. And her lungs

had completely regenerated. She was moving normally and only cried when she was hungry!

We could scarcely believe that there had been such a change within just a few days.

And that after this seemingly endless week of hopelessness, misery and worrying about our small daughter.

On 11 July she was able to leave intensive care and was transferred to another clinic for further orthopaedic treatment. Since the tops of Marleen's thigh bones were not in the acetabulum of the pelvis, she was treated using an overhead extension. She was only allowed to lie on her back and weights hung on her little legs. She was fixed to the bed and was not allowed to leave the bed from 11 July until the first operation on 17 August. This was extremely stressful for Marleen. She didn't want to drink, couldn't burp, couldn't move her legs, couldn't kick about. She often had stomach ache and vomited a lot. Because of the range of medication and antibiotics she was taking, Marleen had slimy, bloody stools.

Bicom therapy was used again. Marleen was stabilised with the corresponding therapy programs, received intestinal programs and was prepared for surgery. She no longer had bloody stools and was also better at taking on liquid.

Marleen had to undergo two operations and we could finally take her home on 7 September 2001. Marleen had to wear an enormous plaster cast on her legs. At the end of January 2002 Marleen was able to move her legs for the first time without a cast or splints. She had recovered very well from the exertions of surgery.

But when Marleen simply could not learn how to crawl, we took her in despair once again to our Bicom therapist in August 2002. She treated Marleen and the following morning Marleen was able to crawl on all fours for the first time. It was unbelievable. We continued treatment and in December she took her first steps.

Unfortunately she had to have a further two hip operations. As a result of the latest operations one femoral head was extremely necrotic and also still very small.

After the operation scars were suppressed with the Bicom and the blockages had been removed, attenuating magnetic field therapy, which was also integrated into the Bicom device, was added to the therapy programs using the patient's own frequency patterns.

The final x-ray check showed that the femoral head had grown at an above-average rate and the necrosis had shrunk drastically. There was no longer a problem with constriction of the spinal canal or scoliosis.

Marleen is developing really well. She can walk normally and is a very happy, balanced and alert child.

We are so proud of her for overcoming these problems. She now also has a little brother and we are happy to have two such wonderful children.

We are so grateful for bioresonance therapy and cannot thank our naturopath enough for her work. We really wish that bioresonance therapy was also available to other children, particularly those who have to go to hospital.

Yours, Petra and Matthias Striegel  
March 2004

**Editor's note:**

The parents are still in contact with Regumed and report that Marleen now goes to school and is a very talented student, is an avid skier and is also very musical, enjoys ballet and plays piano.

## Musculoskeletal system / Neurology

### Sudeck's disease and periostitis

**Therapist: "I'm pleased that I opted to try this form of therapy!"**

During my exams I was quite fatigued and feeling drained. I had real problems concentrating and was always tired. Restorative tonics and vitamins prescribed by the doctor didn't help at all.

It was recommended that I try a bioresonance therapist, who completely restored me to health within just one week by using the Bicom device. During general testing she told me that I had a parasitic stress, which needed to be treated.

Being somewhat sceptical, I got a conventional medical practitioner to reconfirm this and was given the same diagnosis.

**I then made the decision that sooner or later I would work with bioresonance therapy in my practice too.**

I have been an avid Bicom therapist for a year now. I treat a number of acute and chronic disorders. I would like to pass on details about two of my best cases for other colleagues to read about.

A 17-year-old girl broke her scaphoid bone while playing handball. The break didn't heal properly and her arm was in plaster for 18 weeks. After the cast was removed, her movement was hugely restricted. A few days after the cast was removed her hand swelled up and became excessively sweaty and she was unable to use her lower arm. The patient could no longer write at school. She came to my practice, diagnosed with Sudeck's disease.

I treated her once a week on five occasions with therapy programs stored in the Bicom. I predominantly used programs for nerve pain, muscular pain and neck joint blockage.

**After these five therapy sessions functionality was fully restored in her arm.**

The young girl was completely symptom-free after Bicom treatment and is delighted with the rapid and lasting results. Now she is even considering playing handball again.

Sometimes sufferers of Sudeck's disease experience pain for years at a time, sometimes even throughout their lives. I am excited to see whether I can achieve similar success with others suffering from Sudeck's disease.

In the second case that I would like to report on, I treated a new patient who came to me one Monday morning. She could practically no longer walk.

I diagnosed periostitis caused by an excessive strain. She had been training every day for weeks for a marathon, which was to take place in five days' time. She really wanted to take part in this marathon and wanted me to give her medication to ease the pain. I offered to try bioresonance therapy, although I wasn't sure whether I would be able to achieve a result by the Saturday. Programs for muscular pain and inflammations as well as lymph activation stored in the Bicom were also helpful in this instance.

**Straight after therapy there was an improvement and the following day the patient no longer felt any pain.**

She was able to run the marathon the following weekend without any pain.

Bicom therapy is still in its infancy in my practice, but I expect it to grow and I'm pleased that I opted to try this form of therapy.

Dr. med. D. Hug,  
Specialist in General Medicine from Frankfurt

## **Musculoskeletal system / Neurology**

### **Rheumatism and osteochondrosis**

#### **No longer any need for orthopaedic shoes, able to ride and ski again**

My first contact with Bicom was some ten years ago when I attended a presentation. I was sceptical and thought to myself: "If it worked that well, everyone would be healthy!"

But then one of my colleagues, who suffered from neurodermatitis, was tested by a Bicom therapist and told me when she came back that she had numerous allergies. "And now they are being removed!" she said. "Nonsense!" I replied. "Allergies can't simply be removed!" But she went ahead with the treatment and was almost free of symptoms after three months.

This really impressed me and so I bought a device. After I attended my first bioresonance seminar, I gave a presentation in front of 25 patients, who then all wanted an appointment.

#### **My practice was growing at an unprecedented rate.**

Here are two cases which I remember vividly.

A lady, 40 years young, had psoriasis which had developed into rheumatism (also known as psoriatic arthritis). She had bad joint pain, deformities, could sometimes barely walk and could not move her fingers properly. Extensive testing revealed that she had an allergy to various foods. I treated these allergies with the Bicom device. I also used the rheumatism programs stored in the device at the same time and I carried out own blood therapy through the Bicom in order to strengthen the immune system, a process which, incidentally, is completely pain-free for patients. In addition some organ ampoules were used and the information was then oscillated to the patient using the Bicom device.

The patient was treated at weekly intervals. The entire treatment lasted around half a year, until she said: "I don't know what to make of it - I feel so good!" She had suffered the symptoms for a number of years and now has been free of all symptoms for 18 months. The deformities have considerably improved. She can walk again and move her fingers well enough to continue her work as a secretary. She can even knit again now.

The second case concerns a 13-year-old girl. For six years she had been experiencing symptoms, which were diagnosed as queried osteochondrosis (bone and cartilage degeneration). She was suffering from acute pain from her lower legs to her ankles and was so weak that she could scarcely walk. The child needed to wear orthoses (orthopaedic brace to stabilise and bring relief to the limbs) and was always carried around by her father. She frequently had a high temperature. She could no longer go riding, which was her favourite sport. And so, pale and listless, she came to my practice.

I carried out a similar rheumatism and own blood therapy as outlined before. After the fourth treatment the girl no longer needed a walking aid.

**The orthopaedic surgeon at the hospital, an authority in his field, was stunned to see this change after all these years.**

“I don't know what bioresonance is and I don't know the naturopath either, but it's good news so keep going!” he remarked.

After the tenth session the therapy was complete. She no longer had to wear orthopaedic shoes and could ride again and even ski! This was previously unthinkable!

Angelika Prigge-Jugsch

## **Musculoskeletal system / Neurology**

### **Using bioresonance in an orthopaedic practice:**

## **Rapid and lasting improvement not only in cases of arthrosis, but also for sports' injuries**

In our orthopaedic practice we use the Bicom device particularly for treating acute sports' injuries, such as acute traumas. We have experienced very good results with torn muscle fibres and distortion traumas. But we have also used bioresonance therapy as an accompanying measure for fractures. For example, we were able to significantly reduce the pain of an older patient with a pelvic fracture with just two Bicom treatments.

3–5 treatments are generally needed for sports' injuries. The healing process is significantly shortened through Bicom treatment and patients can quickly return to their sporting activities.

Even in cases of arthrosis we are able to achieve a rapid and lasting improvement using Bicom therapy in the majority of cases.

This we treated around 20 arthrosis patients and were able to achieve very good results.

Particularly during the active phase of arthrosis, where there is acute cartilage degradation and the joints affected are extremely swollen and inflamed, Bicom therapy works very well in my opinion.

The key aspect here is that using the bioresonance method the inflammation in the cartilage can be removed and the degradation stopped. There are programs stored in the Bicom device for this purpose.

After my diagnosis was made treatment was carried out by my assistant.

The following programs are frequently used by us: 'Tissue process acute or chronic', 'all types of injuries' or for acute swelling, programs such as 'lymph activation' or 'lymph oedema'.

A 70-year-old patient, who already had burnt-out knee joint arthrosis also benefited from this treatment. After a fall when he twisted his knee joint an acute swelling developed along with haemarthrosis (bleeding in a joint).

After this fall he would also have been a good candidate for a knee joint prosthesis. Through treatment with the Bicom bioresonance method the pain and also the swelling completely subsided within two days.

This patient now comes every 6 – 8 months and receives two to three treatments. The patient remains free of pain and is happy that he has been spared from having to have an operation to fit a prosthetic limb.

Although Bicom therapy is a chargeable treatment, it has been popular in our practice. Chronically ill patients are very grateful if they can be freed from their pain and are quite prepared to shoulder the cost of treatment.

Dr. med. R. Schubert

## Musculoskeletal system / Neurology

### Post-Herpes zoster neuralgia

#### **After Bicom treatment pain-free walking holiday in Nepal**

The 76-year-old patient was suffering increasing sciatic pain in her left leg. A typical Herpes zoster rash developed, with haemorrhagic, grouped blisters and inflamed reddening of the lumbar segments L4/L5 left. First of all she was treated with oral Aciclovir.

Nine days later the rash began to dry out, but the pain remained. After a further twelve days the pain had spread throughout the whole left leg together with a sensation of heat, impaired general health and oedema in the instep. The patient was unable to wear proper ladies' shoes anymore and entered the practice limping, supported on her husband's arm. The rash was completely healed, however. The patient received basic therapy with the Bicom device.

One day later the pain was considerably better, but the subjective feeling of having a lame, heavy stump for a leg remained. She was also suffering from sensitivity problems in this leg.

On the second day meridian treatment on the lymph meridian was carried out with Bicom (corresponding therapy programs for every meridian are stored in the Bicom). Immediately after this treatment the pain was reduced again and the feeling that her leg was a useless stump had disappeared.

The patient left the practice with a real spring in her step. Days afterwards she reported that in the night she had suffered diarrhoea, headaches and shivering, which was a reaction to the elimination. Her leg felt normal again. The pain had completely disappeared and she could get her shoes on again.

A short time later she went on a walking holiday in Nepal without suffering any symptoms.

Dr. med. F. B.

## **Neurosurgeon reports:**

### **In 124 cases of herniated discs: bioresonance instead of operating**

At the 2007 International Bicom Congress in Fulda Dr. Kiran from Istanbul reported on the use of the bioresonance method for treating herniated discs. Below is an extract from her paper.

For more than a year I have been using the bioresonance method in my practice. My work covers the entire spectrum of neurosurgery. I work in my own practice as well as in a local hospital in the Bakirköy district of Istanbul. Since I started using the bioresonance method the number of operations on herniated discs has fallen considerably.

Between February 2006 and February 2007 I treated 124 patients with herniated lumbar and cervical discs exclusively using the bioresonance method.

Of these 124 cases, 71 were cervical hernias and 53 lumbar hernias. Without exception all patients had been treated using conventional medicine and were referred to me by colleagues for surgery. Through medical imaging processes (e.g. MRI) all patients were given a clear diagnosis: herniated disc 2nd – 3rd degree, in some cases with neurological deficit.

#### **Treatment using the bioresonance method**

When administering treatment with the bioresonance method success is dependent on being able to recognise and remove therapy blockages. The Bicom device can be used to find out which therapy blockages are present.

During testing attention should be directed in particular to the following programs which are already stored in the Bicom:

- Prog. mandibular joint correction
- Prog. liver detoxification/toxin elimination (for blockages through toxin stresses)
- Prog. spinal blockage
- Prog. spinal segment blocked
- Prog. blockage in the sacrum/coccyx

In almost all patients the aforementioned blockages were present. After treating these blockages with the Bicom device (two to three sessions) specific therapies were then carried out with the 'herniated disc, supporting' and 'worn intervertebral discs' programs.

All patients were experiencing pain and were also stressed from enduring long periods of pain and were suffering tension within their back musculature. I also treated these muscular tensions

with the Bicom device. Pain therapy programs were also used, particularly the 'neuralgia' program.

If there was already evidence of loss of nerve function, I used the 'nerve degeneration (reflex problems)' and 'nerve acute-inflammatory' programs. To strengthen the musculature the 'muscular atrophy' and 'muscle coordination problems' programs were particularly suitable.

Without exception all patients responded to these programs. On average, 12 sessions per patient were required. Before treatment began, MRI images were prepared to check the patients' condition.

**In level 2 patients the herniated discs were no longer evident in radiological scans. In level 3 patients the extent of the hernias had been significantly reduced.**

Case studies

Mr T. Y., 58 years old. Condition after two intervertebral disc operations, the last operation five months ago. The patient was referred to me by an orthopaedic specialist after a third operation had been refused.

Laseque left 30°. Right foot plantarflexion - 3/5 muscle weakening. On the MRI images amplified granulation and small hernia. The patient was treated with the corresponding programs in just three sessions. Afterwards neurological examinations showed completely normal levels and the patient was free of pain.

Ms F. A., 68 years old For two years left foot drop and for six months right foot drop as a result of hernias L4-5 and L5-S1. The patient had already been urged two years before to have surgery as a matter of priority. However, the patient refused surgery despite her condition deteriorating. From a conventional medicine and neurosurgical point of view these symptoms revealed the necessity to have an operation within 48 hours.

Knowing this and because the patient had been suffering for so long I didn't give the patient or myself much hope of a complete remission through bioresonance therapy.

After the initial sessions the pain increased. For the therapist this is a good sign (initial exacerbation) but for the pain-addled patient this was seen as a further setback. I encouraged the patient to carry on with bioresonance therapy. Treatment lasted four months in all and afterwards he was in complete remission. This result was surprising even for me.

I can warmly recommend the use of the bioresonance method to treat cervical and lumbar hernias to all colleagues .

Dr. Özlem Kiran  
Istanbul

## Egypt:

### Brain paralysis treated

#### **Attending doctor: "The boy had really started to live ..."**

At the 2004 BICOM Congress in Fulda Egyptian doctor and bioresonance therapist Dr. Morkos reported on the treatment of two children, who had suffered from cerebral palsy since birth. It was a very thought-provoking presentation. Both children were treated with Bicom bioresonance, combined with physiotherapy after all other treatment had been stopped some time earlier because it wasn't working.

Progress with the treatment was documented on video. There were moving and poignant pictures, which participants at the Congress had the chance to see and which proved how much bioresonance therapy had improved the quality of life of these children. Here is the story of one of these children.

Dr. Morkos: "The first case concerned Mohamed, an eleven-year-old boy, who had suffered from cerebral palsy since birth. He was unable to communicate or show any emotion towards others. He was not able to move actively or correct his trunk balance. His arms and legs were badly deformed, particularly his elbow, hip and knee. He simply lay there, without moving, unresponsive, and completely isolated from his environment.

I treated him twice a week with bioresonance therapy and he also received physiotherapy.

After four months he was able to sit with his legs crossed at the knees and back supported. The deformities at the bends of his elbows had improved. Shortly afterwards he was able to sit by himself for a few minutes. The deformities in his knee bends were also considerably better after six months. He was able to control his head and sit on a chair with back support. And he responded to acoustic and visual stimuli!

"The boy had really started to live ..."

After eight months he was able to sit on a ball and maintain his balance by supporting his thighs. He could turn his head and was able to maintain his balance while he moved the ball. He responded to songs and moved his head to find the source of the music.

His understanding improved. He now recognised his parents. He understands that his mother will go away to get dressed and he cries as a result. On the TV he recognises children who sing and if he wants to see them he expresses this by crying, so that his parents can sit him in front of the TV. And he shows with his broad smile how well he's doing.

Previously he could do nothing other than lay there and watch time pass by. He has since vastly improved his motor skills and is able to interact with his environment and show feelings.

I strongly recommend bioresonance therapy for all physical therapies and rehabilitation measures used to treat cerebral palsy.

In the second case that Dr. Morkos presented it was also possible to achieve fascinating improvements with two-year-old Hala Fáhđ from Saudi Arabia using bioresonance therapy.

During the video presentation the room was as still as it had ever been at the Congress and you could feel how deeply this report had affected and moved those present.

Dr. med. Hany Morkos  
Cairo, Egypt

# Epilepsy in an infant

## Therapist: a treatment that gets to the root of the problem

Seeing children suffer unleashes a deep desire in me to help them. One day I received a call from a mother who was beside herself at hospital. She had been given my number by another patient. Her three-month-old baby had been taken to hospital a few days earlier with acute convulsive attacks and was initially sedated with valium so that he wasn't constantly experiencing attacks. The diagnosis given to the mother by the doctors was that her small son was suffering from infantile spasms, a form of epilepsy. He was therefore given fairly strong anti-epileptic drugs. After he was released from the clinic the mother came with her baby to my practice.

With the Bicom device I tested an acute amalgam stress. I was astonished, because I had previously only tested the presence of amalgam in adults. The mother confirmed that she had a large number of amalgam fillings. Since I did not find any other stresses, I eliminated the tested amalgam from the small boy.

I pointed out to the mother that, even if there was an improvement, she should under no circumstances stop the anti-epileptic drugs straightaway and instead should slowly decrease the dosage. Four weeks later she came back for a check-up and told me that she had since reduced the medication to one third, since a check-up at the clinic had revealed that the child's blood count had drastically worsened as a result of the medication. This side-effect is unfortunately very quick to take hold in children. The doctors were at a loss to know what to do and so after weighing up the risks, decided to drastically reduce the dosage. Their prognosis was very bad. It was therefore even more amazing when within the next few hours the expected convulsive attacks did not materialise. Nothing happened at all. The EEG did not reveal any activity either. The doctors at the clinic could scarcely believe what they were seeing.

That was some two years ago and the boy is no longer taking any form of medication. Despite the original diagnosis he is developing really well.

The great thing about Bicom therapy is that it gets to the root of the problem and is then able to really help many patients, particularly children.

J. Hoffmann  
Naturopath from Vellberg

# Pain

# Back pain

## Rapid treatment without injections?

A 32-year-old patient was complaining about extremely acute back pain. She explained that had been incapacitated for three days a few months earlier by lower back pain and since then she had experienced acute back pain in the lumbar region. She described the pain as sharp and radiating to her bottom and legs.

I tested the programs stored in the Bicom using the bioenergetic test procedure, which from experience I have used to treat these symptoms in the past. But neither the 'blockages in the lumbar vertebra region' nor other typical back programs tested positive. Only the 'scar elimination' program gave a positive test result.

There had to be a scar, which had caused a stress and therefore resulted in the pain in the lumbar region.

The patient explained that her first child was born by caesarean section two years previously. I assumed that the c-section scar was the cause of the problems in the lumbar region. I therefore carried out a scar elimination with the Bicom device.

### **After just two therapy sessions over a period of five days she was completely free of pain.**

I am always amazed how even acute disorders in the musculoskeletal system can be quickly and successfully treated with bioresonance therapy.

A further example of this is a 39-year-old patient, who has been suffering for years from a known, but symptomless and painless herniated disc in the lumbar region. As a result of one false move this was now blocked and causing acute pain.

The orthopaedic specialist he contacted immediately injected him with a drug to combat the pain and said that this would also dissolve the blockage again. He also prescribed him painkillers for emergencies, which he should take as necessary. After an hour the pain returned. In desperation he went to a chiropractor the following day, but this treatment didn't bring any real relief either.

A few days later he came to my practice. During testing the 'remove blockages', 'worn intervertebral discs' and 'neuralgia' programs were used.

**Just two hours after bioresonance treatment the pain had completely disappeared.**

He could scarcely believe how uncomplicated and successful this treatment was. He now no longer needs the painkillers.

Andreas Wildförster,  
Naturopath

## **At least 8 million patients experiencing pain in Germany\***

### **Successfully treating pain**

When I started working with the bioresonance method 12 years ago, allergies were top of my list. After a short time I realised that there were many more indications that could be successfully treated using the Bicom. And so I used this form of treatment for patients experiencing pain as well. I was surprised how quickly most patients improved.

There is a broad spectrum of symptoms which we can treat using pain therapy through the Bicom. For example, pain in the entire musculoskeletal system, for tennis elbow, shoulder-arm syndrome, back pain, joint pain, sports' injuries and also trigeminal neuralgia, Herpes Zoster, sciatica, earache etc.

**An assessment of 98 patients experiencing pain that were treated at my practice revealed the following results:**

<b>Free from pain:</b>	<b>70%</b>
<b>Major improvement:</b>	<b>20%</b>
<b>Slight improvement:</b>	<b>5%</b>
<b>No change:</b>	<b>5%</b>

My pain patients come twice a week for treatment at the practice. Most feel a considerable easing of their pain after the first therapy session. For many patients there is no improvement until three treatments have been carried out. In rare cases the pain gets worse following initial treatment. In the Bicom device there are programs stored which specifically target pain, such as:

- Prog. pain therapy
- Prog. neuralgia
- Prog. remove energy blockages
- Prog. tissue processes, acute

The magnetic field therapy integrated in the Bicom 2000 is especially helpful for pain therapy. With this magnetic field therapy, which is applied at the same time with the aforementioned bioresonance therapy programs, I am able to energetically build up or attenuate patients depending on their situation.

In practice it has been shown that patients with acute pain generally require an attenuating magnetic field therapy. Patients suffering chronic pain on the other hand often require a fortifying magnetic field therapy. This can be explained in that patients with continuous pain suffer from an extreme lack of energy, because overcoming the pain drains a lot of energy.

I can therefore say that this combination of bioresonance therapy, i.e. therapy using the body's own frequency patterns and magnetic field therapy are an excellent tool for treating pain.

I am pleased that I am able to help so many people suffering pain without the damaging side-effects. But for me there is another, very important aspect:

**The bioresonance method has helped my practice make the breakthrough in financial terms too!**

My practice, which used to be small with a maximum of ten to twelve patients every day, has now expanded hugely. My practice now treats around 2 ½ times more patients.

I now have three Bicom devices in permanent use and I am pleased that my daughter has decided to work with me at the practice, as I couldn't cope with all the work on my own. And this has all come from word of mouth.

It goes to show that therapeutic success also brings financial success. Recommendations from satisfied patients are my best source of income.

The only advertising I have undertaken was giving occasional talks on Bicom bioresonance. But I have now largely cut back on this, as experience has shown that after every presentation ten new patients would come to my practice. And we are currently working at full capacity and simply cannot take on any further patients at the moment.

# 82-year-old patient experiencing pain

## Enjoying her gardening again

This original report from a patient was kindly made available to us by Bicom therapist Marcel Riffel. This report was written in 2006 and we are reproducing it word for word (editor's note).

"Dear Mr Riffel,

I feel I must thank you for your thorough and, more importantly, successful treatment of my legs. Since April, thanks to your treatment with bioresonance therapy, I have been completely free of pain and at the age of 82 I feel "light on my feet" again, can look after the house and do a bit of gardening, which brings me particular pleasure.

To summarise:

from November 2005 I suffered acute pain in both lower legs. Only by taking numerous painkillers during the night could I get a few hours' sleep. My various attempts to improve my condition initially involved applying heat, then cold packs and also ointments, but nothing worked!

Finally I consulted a number of doctors, none of whom were able to help me. These included:

1. my GP, who examined me for periostitis. He couldn't detect anything.
2. an orthopaedic surgeon. He took x-rays of my left and right lower legs and carried out an examination of my knee, with the result: my knee was in good shape for my age. X-rays of my spinal column were taken. However, the cause of my pain was still unknown.
3. a neurologist. The nerve fibres leading from the spinal column into my legs were measured using special devices. But nothing was found. I was prescribed strong medication to treat epilepsy, which I didn't take.
4. a vascular specialist measured the circulation from my heart into both legs. But nothing could be found that was causing the pain.

After the aforementioned doctors were unable to help I turned to bioresonance therapy, a glimmer of hope that my daughter had discovered through friends. Until this point I had never heard of bioresonance.

I am, as you know, 82 years old and have, because of the acute pain, never let circumstances stop me coming from the Danube Valley via the Swabian Alps to you for treatment in Nellingen (bus to Ehingen station, train to Ulm, changing for Plochingen – from there by car to Nellingen). This invariably required me to stay overnight with my daughter and I often travelled the same way back - the winter was harsh and the journey across the Swabian Alps often brought black ice, which meant that travelling by train was the safest way to travel. Today I can say that it was worth all the expense, because now I feel 100% better. Very quickly I felt 60% better, then 80, 90 and finally 100%!!

When I came to you my legs felt really bad and the pain in my lower legs was so acute that even tentatively touching the tibia was unbearable.

After the very first treatment I was able to sleep right through for the first time after 10 weeks of broken sleep. The pain came back on the following nights, but the pain was less pronounced; eventually the pain was restricted to the day and even then was much less acute. After the following treatments with bioresonance therapy the pain gradually lessened.

You supported the treatment until the end of therapy with a few physiotherapy sessions.

I would also like to mention that without having to take medication, without injections I have been completely free of pain since April. I don't feel any pressure, no pulling in my legs and even the furry spot on my right lower leg has completely disappeared. Today is the start of July and the pain hasn't returned!

I wish you as much success in your further work as you achieved with me.

Best regards"

*Anna Gabor*

## Acute pain and oedema

### Able to practise as a doctor again

There is so much to explain if you work with the Bicom bioresonance method, as my husband and I have been since 1991 in our physiotherapy practice. We are huge fans of this method.

Normally I carry out a full consultation with my patients and give them detailed information to take home before I treat them with bioresonance. It is very important to us that the patient knows what is happening to them and fully understands the procedure. But I didn't follow this procedure in one particular case - that of a doctor colleague of mine.

I got to know this colleague purely by chance when I visited my mother around eight years ago in a retirement home. My colleague was mid-40s and had her own orthopaedic practice. Some time later I met her again and thought: "Gosh, she looks awful." And in fact after a while she said: "Ms Petereit, I feel terrible!" "Yes," I said, "I can see that." She rolled up her trouser leg and showed me her heavily swollen ankle. "Look - it's been like this for half a year and I have already been given three Prednisone injections!" "Aha, that explains your face, your appearance," I thought to myself. "I have been to an allergologist, an orthopaedic specialist, a nephrologist, a cardiologist and to the tropical diseases institute. They all tell me that I'm healthy," she complained.

**"Because of the pain I can sometimes only walk with crutches. I will have to sell my practice."**

I recommended bioresonance therapy to her. In her distress she immediately agreed and we arranged an appointment for the following day. Using the Bicom device and corresponding test sets my husband set about finding the cause. **The main stress was revealed as intestinal parasites. When she heard this, she responded testily: "No, I've been to the tropical diseases institute. Urine, blood, stools - everything is fine. I've already told you this!"** When I repeated the diagnosis and explained to her a little about the basic principles of bioresonance therapy, she was indignant and repeated: "I have already told you, I went to the tropical diseases institute and have had everything checked out."

I was slowly getting annoyed myself: "Let us at least try!" She shrugged her shoulders. "Yes, if you absolutely have to, do what you want."

**Three different intestinal parasites were tested and treated in the first session using the Bicom device.** I then accompanied her to the lift. As she stood in the lift, she turned round and said to me: "Ms Petereit, either I'm going mad or my ankle pain has subsided."

**We couldn't wait for the follow-up appointment in the following week. She was a different person- more communicative, and told me, rolling up her trouser leg: "Look, the swelling has gone down!"**

The following treatments were just the same as the first. The patient didn't say any more and simply let us work.

**One week later, at the fifth appointment, her symptoms had disappeared and no intestinal parasites were detected during testing.** But this time my husband tested a hormonal stress. She was amazed and revealed that she had not had a period for the past four months.

We treated her with the programs stored in the Bicom for hormonal stresses and agreed to meet again in four weeks.

**At this appointment she appeared with a large bunch of flowers and beamed: "Everything is okay. All my symptoms have disappeared!"**

Since then she continues to send us patients to undergo bioresonance treatment. She has expanded her practice too. It is such a good feeling to be able to help a colleague continue working thanks to bioresonance therapy.

Dr. med. Barbara Petereit

# Urology

# High temperature and bacteria in the urine

## A mystery to everyone

Julian was one week old when I visited him and on this same afternoon something didn't seem to be quite right with him. At about 10pm I felt that I had to go back, as something was clearly wrong. I visited again and he was completely apathetic and wouldn't breastfeed. He had a high temperature and hung from his mother like a doll. We immediately took him to the clinic. The doctor on duty examined the child and bacteria was detected in his urine.

Julian was given an antibiotic drip straightaway and through the night. His temperature went down only slightly and he was still very apathetic and wouldn't drink much. After 24 hours his temperature fluctuated between 37.8/38.3. He was still being given antibiotics because it wasn't clear why bacteria was present in his urine.

It was a complete mystery to everyone. Julian continued to receive antibiotics via a drip every day! This continued for 2 weeks and then the antibiotics were withdrawn, but the bacteria immediately reappeared in his urine. After almost another week of antibiotics I decided along with the paediatrician to take him home from the clinic.

No sooner said than done! I immediately began treatment. We didn't have the correct diagnosis and also didn't know the cause of the disorder. And so I did what I could. Firstly I carried out a basic therapy every day. This was followed by programs for the kidney, efferent urinary tracts, bladder, lymph system, defence, then we transferred the information from the urine into the Bicom device and treated it as though the urine was an allergen. And we did this again and again every day. Eventually after four weeks we were able to reduce the antibiotics, when the child was seven or eight weeks old. This worked to some extent, so we continued treatment every day, Saturday and Sunday included.

When he was three months old we were able to completely stop the antibiotics and every day we checked his urine and there was nothing there. We continued the treatment until December, when little Julian was six months old and since then he hasn't received any further treatment.

It was a major bacterial infection, but where it came from has never been discovered. But it has at least disappeared. And all this without injecting a contrast agent, pumping the bladder full of drugs and x-raying the kidneys. This alone would have been torture for the child, so we are pleased we managed to avoid it.

He is now 1½ years old and has not experienced any further kidney or bladder problems and there is no bacteria present. He is now stable.

Angelika Prigge-Jugsch

## **Urology:**

# **Help with incontinence following a prostate operation**

Incontinence is a subject that most of those affected would rather not talk about. As well as a number of other causes, it is often due to the sphincter not being able to regenerate itself correctly following prostate surgery.

A frequent reason for this is surgical scars. The plexus is damaged and the scars can prevent and block the energy and blood flow in this area. For patients it is often very stressful, because incontinence often lasts for longer than nine months. Some patients even have to live with it for several years.

Bioresonance therapy can in many cases provide help for this rather delicate problem. Based on years of experience with the Bicom device we have managed to combine stored therapy programs that can successfully tackle the problem.

After a basic program has been tested the patient is optionally treated using the following programs: 'scar elimination', 'muscle coordination disorder', 'nerve degeneration', 'mesenchyma therapy', 'regulating urine volume' and 'tissue blockage'. Often a bacterial post-operative stress is also present, which we can additionally treat with bioresonance therapy.

To date we have used these programs to treat some 12 patients suffering from such symptoms. Usually four therapy sessions were needed. A refresher therapy after two or three months has also proven effective in practice. We have made all these patients "watertight" again. This has helped the patients not only physically but emotionally too.

Rita Schwozer, Dr. Arnd Schwozer Practice,  
Urologist from Würzburg

## **Bicom in a urological practice**

### **An end to recurring urinary tract infections**

I very often found that I had exhausted all possibilities when practising conventional medicine in my urology practice to treat recurring urinary tract infections. These options comprised treatment with medication including various antibiotics as well as the usual measures taken to prevent recurrence, i.e. keeping the area warm or drinking plenty of diuretic tea.

Despite these measures many patients experienced recurring urinary tract infections.

Initially I only wanted to try out the Bicom device. I recruited 25 patients who suffered from recurring urinary tract infections and had exhausted all forms of conventional treatment.

The patients were treated with the therapy programs recommended for their symptoms which were stored in the device. Success was almost instantaneous. On average for these 25 patients four treatments were necessary.

For purely prophylactic reasons, two treatments were also carried out every 3 months within the space of two weeks. The whole process started a year ago and 23 of the 25 patients have not experienced any recurrence in their urinary tract infections.

With Bicom bioresonance therapy I have finally found a way to help my patients overcome this painful cycle of recurring infections. I am really impressed with this form of therapy and my work gives me so much pleasure, because I am able to help so many patients.

I recommend bioresonance therapy particularly to patients who experience the same symptoms time and again and who cannot be helped with conventional drugs.

These patients are generally willing to pay for treatment from their own pockets.
